OBSERVATORY CONTROLLER'S MESSAGE

At the time that this Newsletter reaches you the IUE Allocation Committee will most likely just have finished its deliberations over the distribution of the IUE observing time for the ninth round of IUE observations. The total number of shifts requested for this year was slightly less than the previous, however the 3 x oversubscription still shows that IUE remains to be a major astronomical observing facility. The IUEAC has presently a new Chairman in the person of Prof. Harry Nussbaumer, who follows Dr. Alan Willis in the biannual exchange of the IUEAC chairmanship between representatives of the ESA community and the SERC community. The IUE operations with the 2 Gyro-FSS system have nearly reached their normal stability. At low beta angles the S/C still shows at times some not fully controlled oscillations which are causing a slight additional overhead in the operations. The observatory staff is now more or less used to the operations with this "new IUE" and operations proceed as normal with the expected 10% extra overhead. One good side effect of the gyro failure has been the development by the observatory staff of a simpler and faster attitude recovery method in the so-called beta-dot recovery.

At the ESA IUE observatory various developments have been taking place with the intention of further improving the infrastructure. All off-line image processing has now been concentrated in a single area, which is expected to allow us in the near future to allow user access to these facilities. Through the installation of a local-area network in VILSPA it has now been possible to integrate the IUE observatory in the rapid developments taking place in remotely accessible facilities.

This Newsletter is the last one which will appear under the editorship of Barbara Hassall, I would like to thank her here for the excellent job she has done on this important task. She will be replaced as Editor by the new SERC resident astronomer Chris Lloyd, replacing Alan Harris who has just returned to the R.A.L. after a stay of 2 years in VILSPA.

Willem Wamsteker
IUE Observatory Controller

NEW PERSONNEL

Chris Lloyd has recently joined VILSPA as the new UK resident astronomer. In addition to the traditional responsibilities of the UK R.A., he will also take over as editor of the ESA IUE Newsletter. At the Royal Greenwich Observatory Chris worked on the Optical Monitoring of active galactic nuclei, including the Double Quasar and on the evolution of massive binaries. In 1984 he was transferred to RAL and joined the IUE project last year. At VILSPA Chris intends to pursue his work on Wolf-Rayet stars and perhaps get in a little skiing. Chris and his wife Margaret have one son just over a year old.

Charo González has just joined the Observatory as a holder of an ESA Research Fellowship. She studied Physics and Astrophysics at the Complutense University of Madrid. Her astronomical interests are chromospheres and coronae of late type stars, extragalactic H II regions and models of spectral evolution of galaxies, the later being the subject of her recently completed Ph. D. Thesis. Since she will not be involved in real time support, she will devote most of her time to furthering her research, with which we wish her success.

Departures Alan Harris, January 1986

DETAILED SPACECRAFT STATUS REPORT
(superseding ESA IUE Newsletter No.23 p35)

I. SCIENTIFIC INSTRUMENT HARDWARE STATUS

A. CAMERAS (4)

i) Long Wavelength Prime (LWP) - standard camera,
since 16 Oct. 1983.

suffered in the past from READ scan control logic malfunctions, but reset by bad scan detection logic software. This problem has nearly disappeared since March 1984 and has only once been detected since then.

Last BAD SCAN detected: 2 Feb 1985 16:56 UT.

ii) Short Wavelength Prime (SWP) - standard camera.
no operational problems

iii) Long Wavelength Redundant (LWR) - available at 4.5kV
since 1 Nov 1985

Since April 1983, this camera has suffered from discharge in the UVC, producing a bright patch (flare) on the image (Harris, 1985a). However the flare can be avoided by reducing the UVC voltage to 4.5kV. This results in a sensitivity reduction of 27%. Other camera characteristics remain practically unchanged.
(Harris 1985b, Imhoff 1986).

Guest observers with sufficient scientific justification can use LWR at 4.5kV
Added overheads of camera switch ~30 mins.

iv) Short Wavelength Redundant (SWR) - Not available
read section grid voltages usually fail

B. SPECTROGRAPHS (2)

i) Short Wavelength

Entrance Apertures

Large Aperture (SWLA) - oval shape

Length for trailed spectra :

21.4 ± 0.4 arcsec.

Accuracy of trail

Very fast trails (>20 arcsec/sec) sometimes miss aperture for all or part of trail
(Myslinski 1985)

Area for extended sources:

200 ± 5 sq.arcsec (Panek 1982a)

Small Aperture (SWSA)
probably non-circular effective shape
area ~ 6.8 sq. arcsec (Panek 1982a)
point source throughput 0.53 ± 0.13

Orientation - Position angle dependent on relative positions of sun and target (Munoz 1985 Schiffer, 1980a; Patriarchi 1981)

Non-optimum roll impossible with 2-Gyro FSS system

Echelle Mode - functional

Low Dispersion Mode - functional

ii) Long Wavelength

Entrance Apertures

Large Aperture (LWLA) - oval shape
Length for trailed spectra :
20.5 ± 1.0 arcsec.
Trail accuracy as for SW spectrograph.
area for extended sources :
203 ± 6 sq. arcsec (Panek 1982a)

Small Aperture (LWSA)
probably non-circular effective shape
area ~ 6.9 sq. arcsec (Panek 1982a)
point source throughput :
0.49 ± 0.15

Orientation - as for SW spectrograph (Munoz 1985)
Echelle Mode - functional
Low dispersion mode - functional

C. FINE ERROR SENSORS(2)

- i) FES 1 - back-up system last used 1978 Feb 18
2 magnitudes less sensitive than FES 2
- ii) FES 2 - standard
positional accuracy
0.27 arcsec near center of field.
3 arcsec elsewhere
8 arcsec for m < -0.6 or 14.2 < m < 16
- field size 8 arcmin radius
effective wavelength ~ 5200 Å
visual calibration (Holm and Rice 1981,
Stickland 1980)
sensitivity variation (Barylak et al, 1984, 1985)
experiences electronic confusion from

operation aperture closure mechanism and
the Sun shutter mechanism

D. TELESCOPE SUN-SHUTTER

closed twice spontaneously in 1984 and once in 1985
correction by ground command

II. SPACECRAFT (S/C) HARDWARE STATUS

A. GYROS (6)

No. required for three-axis stabilized attitude control - 2+FSS

No. healthy - 2

No. failed - 4

Gyro-1 failed on 1981 March 2, 19:50 GMT

Gyro-2 failed on 1982 July 27, 07:00 GMT

Gyro-6 stuck since turned off for 1979 shadow season)

Gyro-3 failed on 1985 Aug 17, 05:00 GMT

S/C drift rates - 3 to 20 arcsec/hour (in pitch & yaw)
usually largest shortly after slewing

Maneuver accuracy

In 1981 Nov 21 error/length = 4×10^{-4}
(Panek & Baroffio 1982)

Has improved wrt accuracy prior to Gyro-3 failure

In Dec 1985 error/length= 1×10^{-4}

B. REACTION WHEELS(4)

No. required for slewing - 3

No. in use - 3 (pitch, yaw, and roll)

Backup (skewed wheel) never used in orbit

C. HYDRAZINE SYSTEM

Required for reaction wheel maintenance, orbit change
maneuvers, and emergency sun acquisitions

~ 19.5 kg available

usage rate ~ 0.5 kg/year

D. PREDICTED SOLAR ARRAYS FOR 1986

Power positive zone - depends upon activity level

Beta angles 114° to $28^\circ \pm 2^\circ$ with 1 camera reading
and 1 camera exposing

E. BATTERIES(2)

Maximum depth of discharge during shadow season (no.16)
(Aug/Sept 1985)

Battery #1 62.0%
Battery #2 62.0%

F. ON-BOARD COMPUTER(2)

i) OBC 1

Temperature limit 55.8 C
Last crash 1984 Jan 18
Software systems
8K - standard
4K - Present 2-Gyro/FSS control cannot fit in 4K.
Reduced 2-g/FSS system compatible with 4K
system is under development

ii) OBC 2

Backup system never used in orbit

III. IMAGE PROCESSING SYSTEM STATUS

(Alderman, Turnrose, and Northover 1981)

The current system has evolved through a series of modifications. See ESA IUE Newsletter No.21 (NASA IUE Newsletter No.25) and IUE Image Processing Information Manual Version 2.0 and references therein for a full description. The following list indicates the most significant modifications and their implementation dates.

	GSFC	VILSPA
Averaged Intensity Transfer Function	1978 May 22	~ 78 Jun 14
Improved calibration Line Library		
Low dispersion	1978 Sep 21	~ 79 Feb 01
High dispersion	1979 Nov 23	~ 81 Mar 10
Correct SWP ITF error	1979 Jul 07	~ 79 Aug 07
Mean dispersion constants:		
Low dispersion	1979 Oct 30	~ 81 Mar 10
High dispersion	1980 Jul 18	~ 81 Mar 10
Improved calibration Line Library		
"New" Low dispersion software		
Parameterized low dispersion constants	1980 Nov 04	~ 81 Mar 10
Parameterized high dispersion constants		
"New" High dispersion software	1981 May 19	~ 82 Mar 11
New LWP ripple correction	1981 Nov 10	~ 82 Mar 11
Extended LBL for low dispersion	1984 Dec 17	~ 85 Jun 10
	1985 Oct 01	~ 85 Oct 01

IV. INSTRUMENTAL PERFORMANCE

A. NOISE

i) Readout noise ~10 DN/pixel

iii) Periodic noise (microphonics)

SWP - covers entire image - Amplitude generally 1-3 DN
Amplitude may be increased to 10-40 DN by
mechanical activity in S/C, incl. roll slews
frequency ~200 Hz (Northover 1979)

LWR - affects a few lines in ~85% of images
amplitude up to 110 DN
amplitude decays ~25% image line (Panek 1981)
frequency ~300 Hz (Panek 1981)
occurrence associated with heating of
read section of camera
occurrence modified by delaying
read (Holm and Panek 1982)

LWP - occurrence associated with Roll slews
amplitude up to 7 DN.
affects only the lines when a roll slew is
in progress (Faelker 1982)

iii) Bright spots

radioactive disintegrations in phosphor ~30 spots/hr
(Coleman et al. 1977)
permanent blemishes
most pronounced pseudo-emission feature at
~2190 Å low dispersion, large aperture LWR only.
Others (Ponz 1980)

iv) Typical signal/noise ratio

for well exposed point source spectra
SWP - 10-30 old software (Cassatella et al. 1980)
7-27 new software
LWR - 12-21 old software (Settle et al. 1981)
8-15 new software (Barylak 1982)
LWP - 9-25 old software (Settle et al. 1981)
6-18 new software (Barylak, 1982)

v) S/N properties of averaged spectra

(Clarke 1981a)
(West and Shuttleworth 1981)

B. BACKGROUND

i) Phosphorescence fogging

During low-radiation shifts
LWR & SWP 6-10 DN/hour/pixel
LWP 4-7 DN/hour/pixel (Ake 1982)
Fogging rate depends on no. and type of PREPS
before exposure
Overexposures cause "ghost" spectrum fogging
(Snijders 1983).
phosporescence decay rate
 $\sim t^{-0.8}$ up to several hours (Coleman 1978)
unknown after long time intervals

ii) Radiation fogging

caused by Cerenkov radiation from electrons
in the van Allen belts (Coleman et al. 1977)
may be severe near perigee (US shift 2)
recent experience 22% low fogging shifts
15% high fogging shifts
depending on solar activity (Imhoff 1985)

C. PHOTOMETRIC PROPERTIES

i) Upper limits to ITFs (Turnrose 1980)

New ITF's (ITF2) - data taken for LWR, SWP, LWP
ITF generated for LWR but not operational
ITF in production for SWP, LWP

ii) Linearity errors in processed spectra

SWP -10 to -20 percent for Net DN<20
+10 to +15 percent for ave. DN>220 @ 1300 Å
(Holm 1981)
LWR +10 to +20 percent for Net DN<40

LWP mean error +2% for Net DN>100
mean error of -2.5% for Net DN<100
overall RMS error 3%. (Harris 1983a)
(Settle et al. 1981)

D. ABSOLUTE CALIBRATION

i) Low dispersion SWP and LWR (Holm et al. 1982)

ii) High dispersion SWP and LWR (Cassatella et al. 1981)
For new software (Cassatella et al. 1982)

iib) Low dispersion LWP (Blades & Cassatella 1982)
(Cassatella & Harris 1983)

- iii) High dispersion LWP
as for LWR (Cassatella et al, 1983).
- iv) Accuracy of standards
 $\pm 10\%$ 1300A - 3400 A (Bohlin 1985)
- v) Echelle ripple correction (Ake 1981)

E. SENSITIVITY VARIATION

- i) Temperature dependence (Schiffer 1982a)
SWP $\sim -0.5\%/\text{C}$ of head amplifier temperature (THDA)
LWR $\sim -1.1\%/\text{C}$ of THDA
LWP $\sim -0.2\%/\text{C}$ of THDA (Harris 1983b; Sonneborn, 1983)
- ii) Repeatability (1 σ after temperature correction)
(Schiffer 1982a)
SWP 2% in 150 A bins
LWR 2.5% in 300 A bins
LWP 2.5% in 200 A bins, negligible temp correction
(Harris & Cassatella, 1983)
- iii) Temporal dependence (Schiffer 1982a)
SWP $-6.3\%/\text{year}$ @ 1850 A before 1979.3
 $<0.3\%/\text{year}$ since 1979.3
LWR wavelength dependent between -3.5% and $.8\%$ per year.
(Clavel et al 1985; Cacciari and Wamsteker 1982;
Sonneborn 1983).
LWP Wavelength dependent between -1.4% and 0% per year.
(Sonneborn 1983).

F. RESOLUTION

- i) Short wavelength echelle mode
small aperture FWHM 0.085 A @ 1150 A
(Boggess et al. 1978; Imhoff 1983)
0.19 A @ 2100 A
(Boggess et al. 1978)
large/small 1.01 (Penston 1979)

ii) Short wavelength low dispersion mode

a) spectral resolution

large aperture FWHM <5Å (1400-1600Å)
FWHM ~ 7.5Å @ 1900Å

(Cassatella et al 1985)

gain in resolution using SAP: about 8% mean over lambda
(Cassatella et al, 1985)

b) spatial resolution in LAP from cross-profiles:

FWHM 4.6 to 5.9 arcsec at optimum focus
(Cassatella et al, 1985)

iii) Long wavelength echelle mode

small aperture FWHM 0.20 Å

(Boggess et al, 1978; Imhoff 1983)

large/small 1.09

(Penston 1979)

iv) Long wavelength low dispersion mode

a) spectral resolution

LWR large aperture: FWHM ~ 5.8Å (2400-2900Å);
FWHM ~ 7.7Å @ 1900Å

gain in resolution using SAP: <3%
(Cassatella et al, 1985)

LWP large aperture: ~10% - better than LWR
(Cassatella et al, 1985)

b) spatial resolution in LAP from cross-profiles.

LWR 4 to 5.6 arcsec at optimum focus

LWP 3.7 to 4.9 arcsec at optimum focus

(Cassatella et al, 1985)

G. WAVELENGTH ACCURACY

i) Internal consistency of wavelength calibration determinations (Thompson et al. 1981)

SWP 2.0 km/sec

LWR 2.7 km/sec

LWP unknown

ii) Possible systematic errors

SWP unknown now

early data (Leckrone 1980)

LWR ~10 km/sec

LWP unknown

H. MISCELLANEOUS

- i) Grating scattered light
(Clarke 1981b; Stickland 1980; Basri et al 1985;
Crivellari et al 1982)
- ii) Halation: Backscattering of Electrons from the
phosphor decay length $\sim 32 \pm 3$ pixels (Coleman 1978)
- iii) Scattered Light in the Telescope
 $F_{\text{scat}} \propto d^{-2.5}$ F (Schiffer 1982b)
where d is in arcsec ($5 < d < 40$)
- iv) Plate scale
 1.51 ± 0.04 pixel/arcsec (Panek 1982a;
Bohlin et al 1980)
- v) Residual geometric errors in geometrically corrected image
 ± 0.4 arcsec = ± 0.2 pixels (Panek et al, 1982)
- vi) Exposure timing (Schiffer 1980b, Heck 1981)
command units 0.4096 seconds
effective response delay 0.12 seconds LWR, SWP & LWP
(LWP : Imhoff, 1983).
- vii) Longest uninterrupted exposure to date
SWP 15293 1273 minutes

IUE Orbital Elements II *

This report extends the previous compendium of IUE orbital elements (Ehlers 1981) to April 1984. These elements can be used to derive radial velocity corrections as discussed by Jenkins (1979), Harvel (1980), and Schiffer (1982).

Table 1 is the list of orbital elements. Each epoch is given as year, month, and day in the format YYMMDD. The epoch is always at 00:00 GMT. The inclination, longitude of ascending node, argument of perigee, and mean anomaly are given in degrees. The semi-major axis is given in kilometers. The orbital period can be found from the equation

$$P = 1.6586 \times 10^{-4} a^{3/2} \text{ minutes.}$$

The orbit of IUE is continually changing due to anomalies in the earth's gravitational field which accelerate the spacecraft westward. For this reason the orbital elements also change and so are updated frequently. In addition, the satellite must be kept within the field of view of the receiving antennae, both at Goddard Space Flight Center and at Villa Franca, Spain. When the spacecraft drifts too far west, the orbit is corrected using the hydrazine jets. This corrective maneuver (a "delta V") causes the spacecraft drift to reverse direction and drift eastward. The changes in the drift direction represent discontinuities in the orbital elements, particularly the semi-major axis. Breaks in Table 1 indicate such discontinuities due to a delta V. Table 2 lists the dates (format YYMMDD) and GMT times at which the corrective maneuvers were performed. When deriving radial velocity corrections, caution should be used in interpolating values near the times of these discontinuities in order to ensure accurate results. The time changes in Table 2 from Ehlers (1981) resulted from a small uncertainty in the recordkeeping.

Sidney M. Broude and Ruth E. Bradley

IUE Orbital Elements III *

This report extends the previous compendium of IUE orbital elements (Broude and Bradley 1984) through the end of 1984. These elements can be used to derive radial velocity corrections as discussed by Jenkins (1979), Harvel (1980), and Schiffer (1982).

Table 1 is the list of orbital elements. Each epoch is given as year, month, and day in the format YYMMDD. The epoch is always at 00:00 GMT. The inclination, longitude of ascending node, argument of perigee, and mean anomaly are given in degrees. The semi-major axis is given in kilometers. The orbital period can be found from the equation

$$P = 1.6586 \times 10^{-4} a^{3/2} \text{ minutes.}$$

The orbit of IUE is continually changing due to anomalies in the Earth's gravitational field. For this reason the orbital elements also change and so are updated frequently. In addition, the satellite must be kept within the field of view of the receiving antennae, both at Goddard Space Flight Center and at Villa Franca, Spain. When the spacecraft drifts too far west, the orbit is corrected using the hydrazine jets. This corrective maneuver (a "delta V") causes the spacecraft drift to reverse direction and drift eastward. The changes in the drift direction represent discontinuities in the orbital elements, particularly the semi-major axis. Breaks in Table 1 indicate such discontinuities due to a delta V. Table 2 lists the dates (format YYMMDD) and GMT times at which the corrective maneuvers were performed. When deriving radial velocity corrections, caution should be used in interpolating values near the times of these discontinuities in order to ensure accurate results.

In addition, the orbital elements are now recorded in line 83 of the Image Header. The orbital elements have been routinely recorded at GSFC as of July 8, 1983. These are the most current orbital elements for the observation date, as used in the ground command computer. The format is the following: epoch of the orbit (Julian day), seconds, semi-major axis (kilometers), eccentricity, inclination (degrees), ascending node (degrees), argument of perigee (degrees), and mean anomaly (degrees). For all of these elements except the epoch, 8 characters are recorded in floating-point format with no delineations between the elements. An example is given in Figure 1.

EUROPEAN SELECTION COMMITTEE FOR 9TH ROUND OF IUE

The proposals requesting IUE observing time are evaluated by a Selection Committee, which this year will meet in Paris in February. The list of successful European programs will be published (together with the corresponding NASA list) in ESA Newsletter No. 26, once the results have been communicated to the individual applicants. Below we give for your information, the complete members list of this year's ESA Selection Committee, together with the letter representing the research category code of the relevant proposal sub-group.

H. Nussbaumer/Chairman		ETH-Zentrum, Zurich
R.F. Carswell/Vice-Chairman		Cambridge University
J.L. Bertaux	(S)	CNRS, Verrieres, France
P.B. Byrne	(C)	Armagh Observatory
I. Brown	(Q)	Jodrell Bank, Cheshire
V. Castellani	(E)	Universita "La Sapienza", Roma
J. Danziger	(Q)	E.S.O., Munich
K.S. de Boer	(M)	Bonn University
E. van Dessel	(I)	Koninklyle Sterrewacht, Belgium
P.L. Dufton	(A)	Queen's University, Belfast
P. Gondhalekar	(E)	R.A.L., Oxfordshire
W.R. Hamann	(A)	Kiel University
D.W. Hughes	(S)	Sheffield University
H.J. Lamers	(A)	Space Research Laboratory, Utrecht
J. Lequeux	(E)	Observatoire de Marseille
K. Norgaard-Nielsen	(Q)	Copenhagen Observatory
J.E. Pringle	(I)	Cambridge University
L. Smith	(M)	U.C.L., London
F. Spite	(C)	Observatoire de Meudon
R. Stalio	(C)	Trieste Observatory
E. Tanzi	(I)	Laboratorio di Fisica Cosmica, Milano
A. Vidal-Madjar	(M)	Institut d'Astrophysique, Paris

Research Category Code:

S = Solar System
C = Cool Stars
E = Extragalactic
Q = Active Galaxies
(QSO's, etc...)

M = Interstellar Medium
A = Hot Stars (Atmosphere)
I = Hot Stars (Interaction)
E = Galaxies
(Stellar content, etc)

2nd announcement/Call for papers

NEW INSIGHT IN ASTROPHYSICS

EIGHT YEARS OF ULTRAVIOLET ASTRONOMY WITH IUE

An International Symposium

sponsored by ESA, NASA & SERC

to be held at University College,
London, U.K. on
14 - 16 July 1986

NEW INSIGHT IN ASTROPHYSICS

Eight years of Ultraviolet Astronomy with IUE

OBJECTIVES

Alive and well, IUE will soon celebrate its 8th birthday as a successful Ultraviolet Observatory. It is a good opportunity to review its tremendous achievements illustrated by the more than 1000 articles published so far in the main scientific journals. ESA, NASA and the SERC are therefore pleased to announce a joint IUE Conference to be held at the University College, London (UCL) from 14 to 16 July 1986.

PROGRAMME

The scientific programme will consist of a number of invited reviews on topical subjects which have benefited greatly from studies with IUE, followed by open discussions. Other contributions will take the form of poster papers displayed during the appropriate session.

SCIENTIFIC ORGANISING COMMITTEE:

R.Wilson (Chairman,SERC-UCL)
Y.Kondo (Co-chair,NASA-GSFC)
W.Wamsteker (co-chair,ESA-VILSPA)
J.Linski (Boulder),L.A.Wilson (Iowa)
H.Nussbaumer (Zurich),A.J.Willis (UCL)
B.Savage (Wisconsin),M.Grewing (Tubingen).

LOCAL ORGANISING COMMITTEE

A.J. Willis (Chairman,UCL)
D.J.Stickland (Secretary,Rutherford)
I.D.Howarth (UCL)
R.Wilson (UCL)
J.Clavel (Vilspa)

INVITED TALKS

Comets	M. Festou
The Io Torus & Jovian magnetosphere	P. Feldman
Chromospheres of cool stars	C. Jordan
Mass loss & massive stars	(1)
Novae	S. Starrfield
Binaries	J. Sahade
The interstellar medium	M. Schull
Galactic halos	B.D. Savage
Active galactic nuclei	M.H. Ulrich
The Lyman/Fuse mission	R. Wilson & V. Moos

(1) Name not yet available.

Though the agenda is not yet fixed, we expect the reviews to proceed approximately according to the order above. In particular, the reviews and discussions concerning solar system objects will take place the first day, Monday 14 of July.

CONTRIBUTED PAPERS

All papers (invited and posters) will be published as an ESA Special Publication, which will be distributed free of charge to all participants approximately 3 months after the event. Potential participants in the Symposium are kindly requested to return the attached registration form by 1 April 1986. If you intend to make a poster contribution, please indicate on the registration form the authors and title of your paper. Titles reaching the organising committee later than April 1st cannot be guaranteed inclusion in the programme. If you meet the deadline, you will receive camera ready sheets for the preparation of the abstract of your paper, as well as a camera-ready kit for the preparation of the manuscript. The abstracts have to be returned to the secretary of the LOC by May 15, 1986. They will be printed in a small book that will be distributed to all participants at the conference. The completed manuscripts must be submitted to the representative of the ESA Scientific and Technical Publications Branch at the meeting. Contributed papers should not exceed 4 pages.

CALENDAR OF EVENTS

11 January 1986	First announcement
1 April 1986	Return of registration card/call for papers
15 May 1986	Abstracts due
14 July 1986	Return of Camera-ready articles.
October 1986	Proceedings Publication

SOCIAL EVENTS

A welcoming reception is planned for the first evening and a conference cocktail on July 16.

REGISTRATION FEE

To cover various of the conference expenses, a fee of £25 or US\$40 should be sent with your registration form to arrive by 1st April; we regret we cannot accept other currencies. Late payment (including payment at the conference) must be made at the increased rate of £35 or US\$55.

Cheques should be made out to "The IUE conference". Alternatively, payment may be made direct by your bank to "The IUE conference" account (number 0559339) at Lloyds Bank, Harwell, UK (Bank code 30-93-93).

ACCOMMODATION

A block-booking has been made with a group of hotels close to University College. This provides mainly for single rooms but some double or twin bed rooms should be available. Please, tick the appropriate box on the registration form to select the type and price you prefer. The charge quoted is per night and includes an English breakfast. Every effort will be made to meet your wishes, but London is very busy during the summer season and an early reply is essential to secure your first choice of accommodation. No deposit is required. Lunches during the conference can be obtained at the UCL Refectory or in nearby pubs. London abounds with all manner of eating houses for your evening meals !

Symposium on UV Space Astronomy Physical Processes in the Local Interstellar Medium

Call for papers

This symposium will be held on July 4 and 5, 1986, in Toulouse, France, in the context of the XXVith COSPAR Meeting, as the "associated symposium" #7. It is cosponsored by the IAU.

The results obtained with UV space experiments such as VOYAGER, ASTRON, and IUE and other spacecrafts working in the Infrared (IRAS) and X-ray domain, as well as those obtained at very high resolution from ground based observations, have brought new insights on the interstellar medium surrounding our Solar System.

The purpose of this Symposium is to bring together all the new information gathered in the different wavelength domains and compare the results with the theoretical models for the LISM. Special emphasis is given to the spatial distribution and the physical conditions in a region limited to a distance of 200 pc from the Sun. Future UV Space Astronomy experiments will be discussed extensively in the context of their importance for this subject.

As can be seen on the general program and list of invited talks included, there will be a limited amount of time for contributed papers and posters. If you wish to present a contributed paper or poster, you are kindly invited to fill in the attached Abstract Form and return it before January 15 to Dr C. Gry, ESA/VILSPA P.O. Box 54065, 28080 Madrid, Spain, with a copy to the COSPAR Secretariat, 51 Boulevard de Montmorency, 75016 Paris, France.

If you want to attend the symposium, even without presenting a paper, you are referred to the "XXVith Plenary Meeting and Associated Activities", Second Circular, October 1985, edited by COSPAR. The deadline for registration is 31 May 1986. The COSPAR Circular contains all information and registration forms and can be obtained from the COSPAR secretariat.

Scientific Organising Committee:

W.Wamsteker (chairman), A.A.Boyarchuk, F.Bruhweiler,
J.J.Caldwell, G.Courtes, A.Dupree, H.J.Fahr, C.Gry,
F.Paresce.

SYMPOSIUM #7: UV SPACE ASTRONOMY - PHYSICAL PROCESSES IN THE LISM

- PROGRAM AND INVITED TALKS -

SESSION 1: (Friday, July 4, morning)

THE INTERFACE BETWEEN THE HELIOSPHERE AND THE LISM

BARANOV: The interface between the heliosphere and the LISM

FAHR: Is the heliosphere interface submagnetosonic ?

Contributed papers and posters

SESSION 2: (Friday, July 4, afternoon)

SPATIAL STRUCTURE OF THE LOCAL INTERSTELLAR MEDIUM

DE VRIES: IRAS results - relevance to the LISM (cirrus ?)

FERLET: Structure of the LISM from high resolution ground based and UV spectroscopy

JAKOBSEN: UV and X-ray background and the LISM

Contributed papers and posters

SESSION 3: (Saturday, July 5, morning)

COX: Theory of the LISM

* OSTRIKER: McKee and Ostriker theory of the LISM

TOMISAKA: Cycling of the LISM

ARNAUD: Heating of the LISM

Contributed papers and posters

SESSION 4: (Saturday, July 5, afternoon)

REQUIREMENTS FOR THE FUTURE: THE IMPORTANCE OF THE EUV

VIDAL-MADJAR: Lyman

DUPREE: FUSE

POUNDS: The EUV Telescope on ROSAT

BOWYER: The EUV Explorer

OLTHOF: EURECA projects and prospects

Contributed papers and posters

(*) To be confirmed

THE SERC LOW DISPERSION IUE MICROFICHE PLOTS

The IUE observatory at Villafranca is in the process of distributing a catalogue on microfiche of the plots of IUE low resolution spectra. (See Giaretta, ESA IUE Newsletter No.20, p11 and NASA IUE Newsletter No.26, p130. The catalogue, ordered by camera and image number, has been produced at the SERC Rutherford Appleton Laboratory by Dr. D. Giaretta and Miss J. Anya and includes, in its present version, nearly all the low resolution spectra obtained in the period between the launch of IUE and middle 1983. Updates will be delivered which will contain the remaining data.

The catalogue is intended to serve for example in selecting images to be requested from the IUE Data Banks, or for quick look purposes.

The microfiches will be distributed by the IUE three Agencies to many institutes all over the world. The institutes included in the ESA distribution list, ordered by country, are reported below (Table 1).

COMET HALLEY WITH THE FES

This image of Comet Halley was obtained with the Fine Error Sensor on board IUE on December 15th 1985 by M. Festou and R. Gilmozzi, during one of the observing runs of the European Collaboration for the IUE observations of P/Halley. It has been processed by the VILSPA Photolab using a special technique developed for the occasion. The image was taken at 20 kb and FES1ROM format, so achieving the sensitivity of an image taken at 2.5 kb. The extent is 12' x 12', East is at the top right, North at top left. The initial part of the tail is clearly visible pointing east.

FES SENSITIVITY CHANGES

Here are the results of the FES sensitivity monitoring of the 4 standard stars BD+28°4211, BD+75°325, HD 60753 and HD 93521.

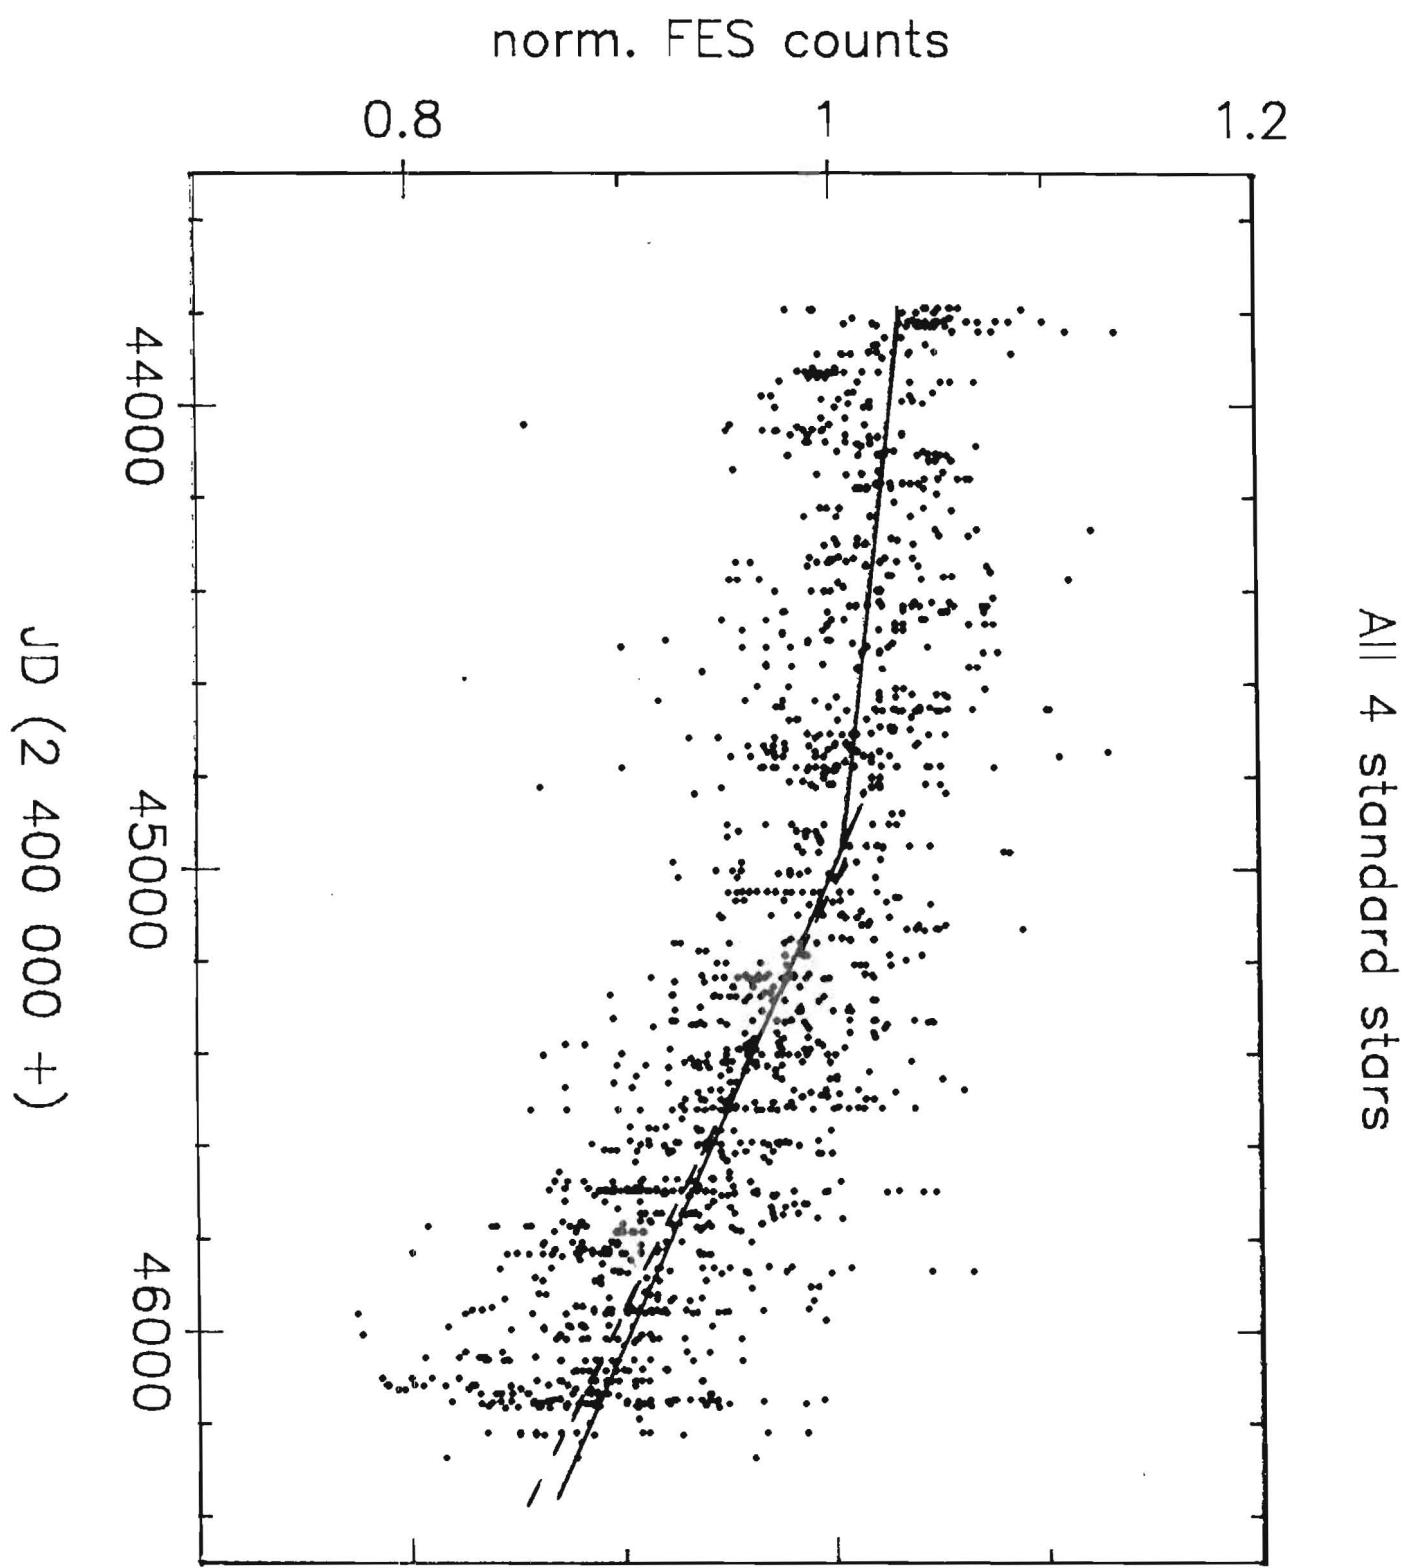

Figure 1 shows the 1432 FES counts measurements (VILSPA and GSFC data in FO mode only) normalized to the means calculated last year (see IUE ESA Newsletter 20, p 60,61). The solid line indicates the fit calculated one year ago, the dashed line the current decrease of sensitivity.

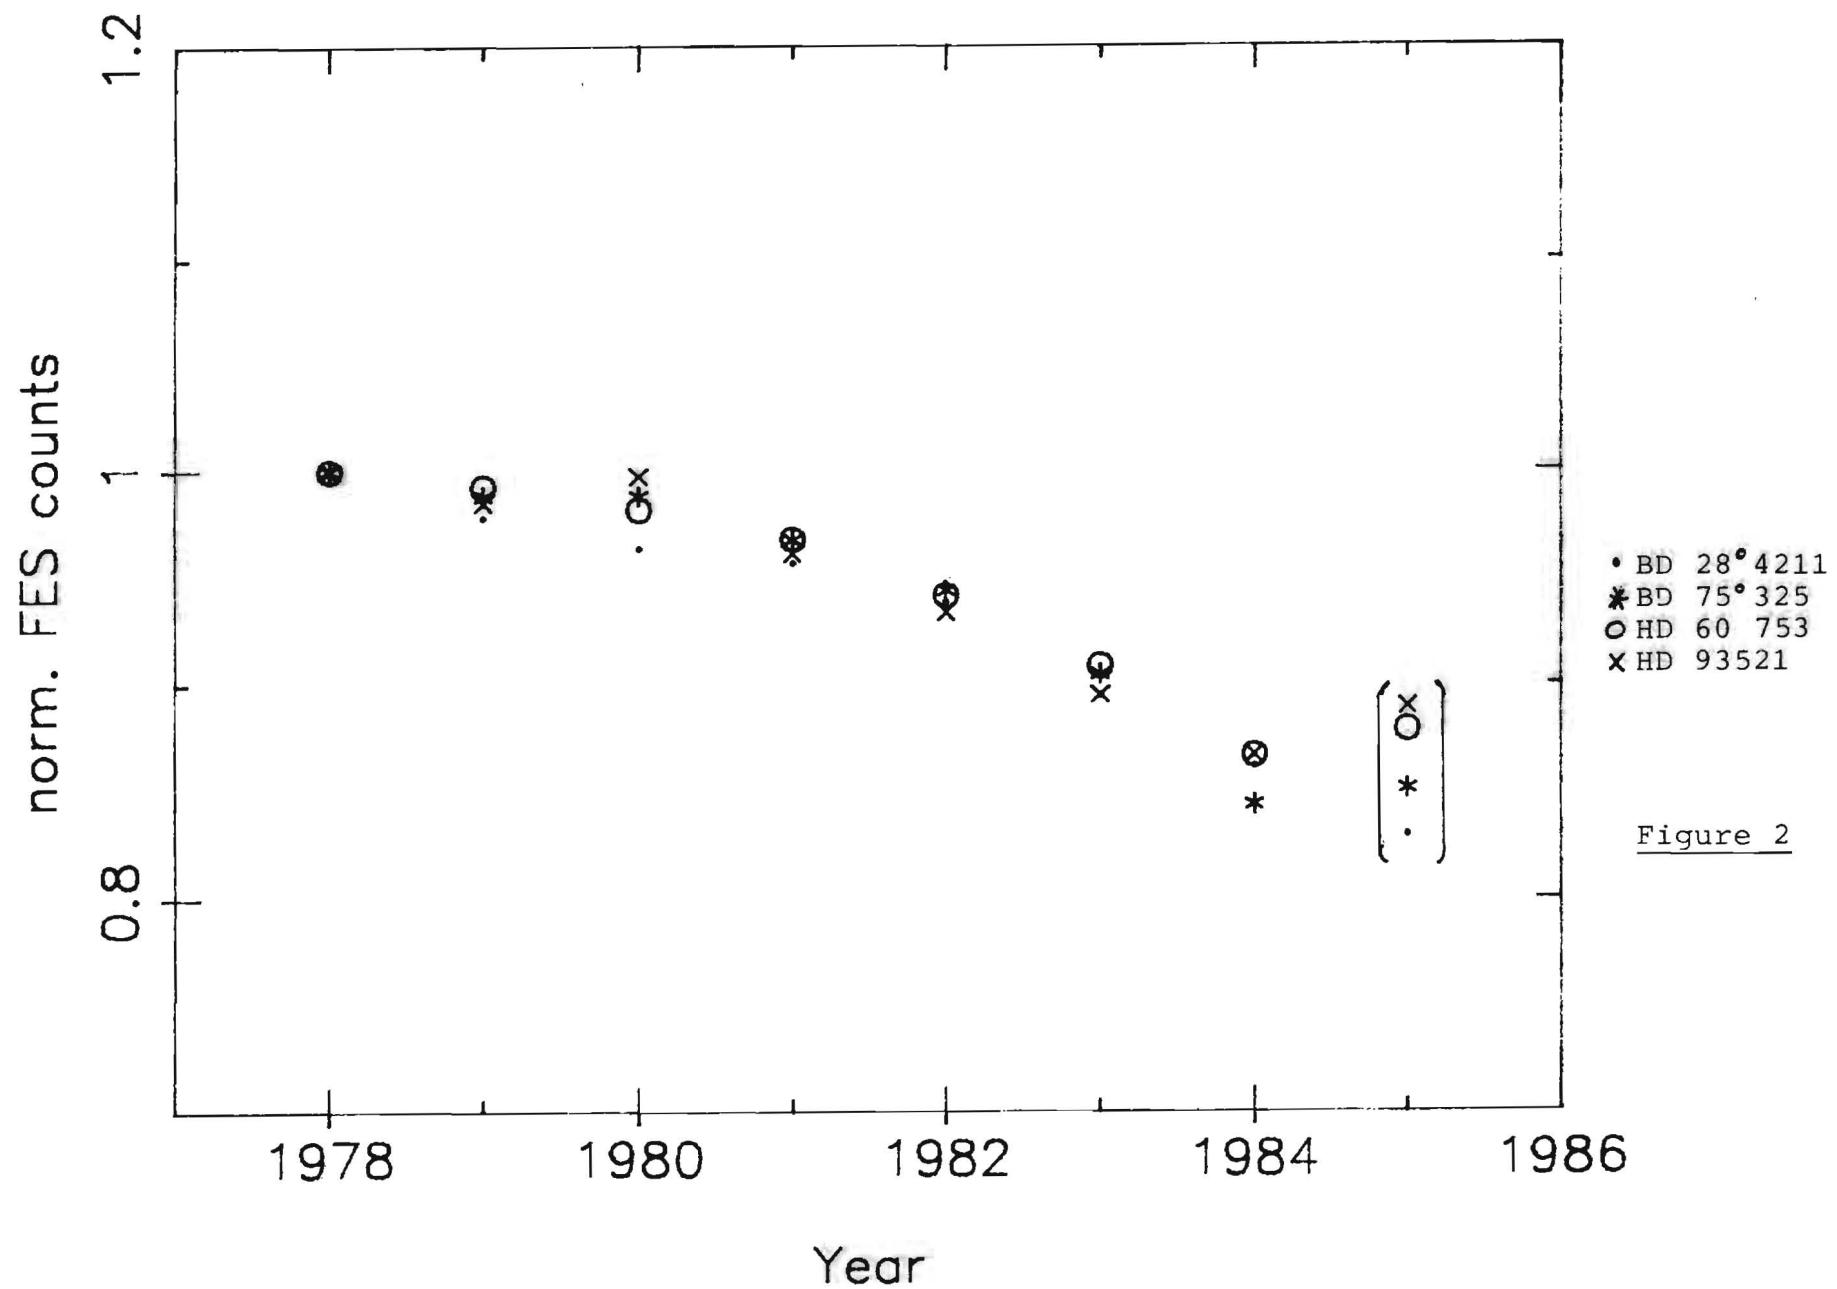

Figure 2 displays the decrease of the sensitivity taking the IUE year's mean and normalizing to the mean of the FES counts of the first year (i.e. 1 April 1978 till 1 April 1979). The points in parenthesis are for 1985 and represent only April and May data and hence are not indicative.

To summarize, the results indicate that the current rate of sensitivity decrease has increased and is currently about 5% per year (in the worst case 7% per year) instead of the formerly calculated 3% per year.

Figure 1

LWR Camera and ITF Performance with 4.5 kv UVC *

Catherine L. Imhoff
28 October 1985

Abstract: A comparison of LWR UV-flood lamp images obtained at 5.0 kv and 4.5 kv UVC settings indicates that the current ITF performs equally well at both settings. Thus there is no need to derive a new ITF to calibrate the new configuration of the LWR camera at 4.5 kv. A small effect in the camera response is seen at the extreme edge of the images, corresponding with the slightly lowered sensitivity noted at the ends of the orders of high dispersion stellar spectra by Harris (1984).

1. Introduction

At the May 1984 Three Agency meeting, it was resolved to study the reconfiguration of the LWR camera with a reduced UVC voltage of 4.5 kv in order to avoid the effects of the UVC flare. Before the reconfiguration, we wished to analyze the performance of the current calibrations for the camera. The camera response to the UV-flood lamps used for calibration and the performance of the current Intensity Transfer Function (ITF) are of particular interest for the new configuration.

To provide data on the ITF performance, VILSPA obtained a special set of camera baseline images in June 1984 with the LWR UVC set to 4.5 kv (LWR 17422 - 17432), in addition to the standard images in May with the UVC at 5.0 kv (LWR 17406 - 17415). These images are standard sequences of UV-flood images and nulls similar to those used to construct the ITF calibration. They are normally obtained for each camera at intervals of six months in order to monitor the performance of the cameras. The following analysis is based on these images. Both sets of camera baseline images were processed using the current LWR ITF (ITF1). Since standard exposure times were used for the images, the DN levels and thus the FN levels are proportionally lower for the 4.5 kv images compared to the 5.0 kv images, due to the lower gain at the lower UVC setting.

Two basic questions are to be answered. One is whether or not the relation between the DN and FN is the same for both UVC settings at each pixel in the image (the ITF performance). A second is a comparison of the camera response to the illuminating UV-flood lamps when the UVC is at the two different settings. Several steps were used for the analysis. First, the behavior of the ITF averaged over a large central portion of the image was studied at both UVC settings. Second, the relative behavior of different regions in the similar UV-flood images was analyzed. Next, small regions distributed around the image were chosen for detailed spatial analysis. Finally, an analysis was made of the signal-to-noise in the images for both UVC settings. These results were previously presented to the Three Agencies in two reports (Imhoff 1984, Imhoff 1985).

* Reprinted from NASA IUE Newsletter N° 28

Editor's note: a complementary study by Harris 1985 was published in ESA IUE Newsletter N° 24, p. 17

2. Overall Performance of the ITF for UV-Flood Images

To study the ITF performance on the image as a whole, the mean FN for a 432 pixel by 432 pixel area in the center of each image was computed, using the standard flat-field statistics routine BOXSTAT. If the current ITF calibrates the 4.5 kv images as well as it does the 5.0 kv ones, the relation between the FNs of corresponding images should be a straight line with a slope determined by the difference in gain (and any intervening lamp degradation). The values found for the test images are given in Table 1 and plotted in Figure 1. As one may see, the relation between the mean FNs is indeed a straight line. The slope determined from a least-squares fit is 0.7377, which corresponds to a gain ratio of 1.356 (ignoring lamp degradation). This value agrees very well with the value of 1.37 determined by Harris (1984) from stellar spectra. Thus the current ITF appears to adequately calibrate the overall 4.5 kv LWR images, up to the highest DN levels in the test images. The latter limitation corresponds to saturation in the lower left quadrant of the image, 210 DN at the center of the image, and about 170 DN at 2800 Å in the low dispersion spectrum.

3. Tilt in the Photometrically Corrected UV-Flood Images

The second part of the analysis is to examine the relative behavior of different areas within the image. If the ITF performs equally well with 5.0 kv and 4.5 kv UVC settings, the tilt, or deviation from flatness of the photometrically corrected image, should be about the same for images with comparable DN levels. The tilt is defined to be the difference in FNs between two standard regions of 3600 pixels ("B", centered on line = 168 and sample = 528, and "F", centered on line = 636 and sample = 312) in the photometrically corrected image. A perfect ITF should produce uniform FNs across the image. Due to slow changes in the camera since 1978, the current LWR ITF produces some tilt in the 5.0 kv baseline images. Figure 2 depicts the variation in the tilt versus exposure level (mean FN) in Regions B and F for both the 5.0 kv and 4.5 kv images. The relations are the same.

4. Detailed Analysis in Comparable UV-Flood Images

A few of the available UV-flood images were used to perform a detailed analysis of the camera response and ITF performance. Since the standard exposure times were used for both camera baseline sequences, the DN levels are proportionally lower for the 4.5 kv images than the 5.0 kv images. However, for two pairs of images the DN levels are nearly the same (see Table 1). For these images the difference in gain is nearly balanced by the difference in exposure time, resulting in similar DN levels. These pairs of comparable images allow one to examine the response of the camera at the two UVC settings and the performance of the ITF on these images.

Twenty-one areas were chosen, distributed around the image, for this study. Each area consists of a 12 pixel by 12 pixel box, with a mean and standard deviation generated by the standard BOXSTAT routine. The areas are distributed from 96 to 672 in both line and sample number, thus extending over most of the useful area of the camera faceplate.

Figure 3 depicts the mean DNs in each of the 12 areas for each pair of images. Areas that represent regions close to saturation (DN > 240) are indicated by parentheses and omitted from the statistics discussed below. The two nulls are quite comparable, as one might expect since no exposure is performed. The null represents the pedestal of positive signal (typically 25 DN) present after the camera has been prepared but not exposed.

In order to examine the response of the camera to the UV-flood lamp at the two UVC settings, one must first remove the small systematic differences in the DN levels of the pairs of images. For each of the UV-flood images, the null level was subtracted. Then R_i , the ratio of the "signal" (i.e. UV-flood mean DN - null mean DN) at 4.5 kv to that at 5.0 kv for area i , was computed for each of the 21 areas. Specifically:

$$R_i = \frac{\text{UVFDN}_i(4.5 \text{ kv}) - \text{NULLDN}_i(4.5 \text{ kv})}{\text{UVFDN}_i(5.0 \text{ kv}) - \text{NULLDN}_i(5.0 \text{ kv})}$$

The mean of these ratios, $\langle R \rangle$, was computed for each pair of images. The mean represents the overall systematic difference in the DN levels of the two images (0.97 and 0.99 respectively for these pairs of images). Then the residuals for each area compared to the mean were calculated and converted to percentage, that is $100 * (R_i - \langle R \rangle) / \langle R \rangle$. These are given in Figure 4. The residuals may be used to locate systematic or location-dependent effects.

No strong pattern emerges from either of these pairs of images. The second pair of images shows the larger effects, on the order of 2%. This pattern is reminiscent of the "edge effect" seen by Harris (1984) in high dispersion stellar spectra. If one superimposes the location of the high dispersion orders, which run from the lower left to the upper right in the figures, one can see that the ends of the orders would be depressed by about 3% from the centers of the orders. However, the residuals do not repeat very well between the two pairs of images.

To test the performance of the ITF, the same series of calculations were done for the photometrically corrected images. Figure 5 depicts the mean FNs, scaled by a factor of 70, for the 21 areas in each image. Figure 6 shows the residuals, expressed in percentages. As before, no strong patterns are evident in the residuals.

If the ITF works as well for the 4.5 kv images as for the 5.0 kv images, then the pattern of residuals should be the same for the DNs and FNs. Figure 8 shows the differences in the residuals (FNs minus DNs). No strong or repeatable pattern emerges. Most differences are on the order of 1% or less. Thus the ITF appears to work well for images obtained with either UVC setting.

5. Signal-to-Noise Characteristics

Another comparison which may be made is the signal-to-noise for images obtained at 4.5 kv and 5.0 kv. The average signal-to-noise for the central portion of each image (432 pixels by 432 pixels) was determined using the standard BOXSTAT routine (Table 1). No differences in the S/N characteristics were found for UV-flood images with comparable DN values (Figure 8). In addition, the S/N ratios for the 21 areas in the pairs of images were computed to look for location-dependent differences between the 5.0 kv and 4.5 kv images. No pattern is evident.

6. Conclusions

We conclude that the camera responds reasonably equally to the UV-flood lamp at 4.5 kv and 5.0 kv UVC settings. There is some indication at the 2 to 3 % level of the "edge effect" noted by Harris (1984) in high dispersion stellar spectra. The LWR ITF performs equally well at either UVC setting for the exposure levels studied. Thus it is not necessary to obtain a new ITF before using the LWR at the 4.5 kv UVC setting.

: STARS OBSERVED WITH I.U.E.

From 1978 to the beginning of 1985, the number of stars with luminosity class from Ia (brightest supergiants) to V (dwarfs) (excluding WC, WN, Symbiotic stars ...and another "strange" stars) that have been observed with I.U.E. in high dispersion mode are 2560. In order to determine how many of them belong to each spectral type and luminosity class we have performed a statistical study of the I.U.E. Archive. We have selected stars in the following classes in the I.U.E. object classification: class 13 (supergiants 0), class 23 (B0-2 III-I), class 24 (B3-5 III-I), class 25 (B6-9.5 III-I), class 32 (A0-3 III-I), class 33 (A4-9 III-I), class 40 (F0-F2), class 41 (F3-F9), class 45 (G III-I), class 47 (K III-I) class 49 (M III-I), class 12 (0 V), class 14 (0e), class 15 (0f), class 20 (B0-2 IV-V), class 21 (B3-5 IV-V), class 22 (B6-9.5 IV-V), class 26 (Be), class 27 (Bp), class 30 (A0-3 IV-V), class 31 (A4-9 IV-V), class 34 (Ae), class 35 (Am), class 36 (Ap) and class 42 (Fp). For each one of them, both spectral type and luminosity class have been taken from the I.U.E. Merged Log, except for stars included in classes 13, 23, 24, 25, 32, 33, 40, 41, 45, 47 and 49. For these, both spectral type and luminosity class have been adopted from the C.D.S. This source is considered more reliable and uniform than the I.U.E. Merged Log.

We have represented in Table 1 the results we have obtained. The spectral type and the luminosity class most observed are B and IV-V respectively.

In addition we have calculated how many supergiants of each spectral subtype have been observed in order to check whether or not this distribution describes in a realistic way the "supergiants world". Results have been represented in figures 1a, 1b and 1c for luminosity classes: Ia, Ib and Ic, respectively.

We have compared the distribution we have found (see figures 1a, 1b and 1c) with the statistics made in 1971 by Fehrenbach of the 701 supergiants included at that time in the Humphreys catalog which includes all the supergiants for which either spectrophotometry or VR index are known (see figures 2a, 2b and 2c). You will notice that the two distributions are quite similar, despite the I.U.E. selection effect which favours early type stars; there is a genuine lack of late spectral types. As a matter of fact, the almost total absence of Ia stars with spectral type cooler than G0 has also been found in the Magellanic Clouds (Fehrenbach, 1971) and poses one of the greatest problems for any stellar evolution theory.

SKYMAP OF OBJECTS OBSERVED WITH IUE IN LORES

Related to the previous article on the statistics of the distribution of objects observed with IUE in high dispersion we show in the two following pictures the distribution of two typical (one galactic and one extragalactic) classes of objects in low dispersion. In figure 1 the usual sky appearance of objects concentrated to the galactic plane is clearly shown by the (2000) B-stars observations made with IUE. Also the concentrations from the two nearest galaxies LMC and SMC can be easily seen.

Similarly in figure 2 the zone of avoidance of the galactic plane is shown by the distribution of the 1700 observations of globular clusters and galaxies. Note that in the case of the LMC and SMC the extensive observations of the blue Magellanic Cloud clusters give a region of correspondence for these two distributions which are otherwise fully complementary.

It is interesting to see that these familiar, distributions are after 8 years of observing so well defined. These pictures give a good indication that the extension of IUE is indeed of great importance for Astronomy. Although many observations on individual objects are repeated for astrophysically very important variability studies, the figures also show that the Database which is being built up does not only contain astronomical peculiarities but will indeed at the final stages of the project (1990?) really give an archive representing the present knowledge and understanding of extended classes of objects.

It is expected that such analyses of the IUE database contents will help the project in future decisions such as the analysis of the completeness of the IUE archive as was requested by the IUE long range planning committee.

#####
# VILSPA PUBLICATIONS LIST #
# IN MAIN JOURNALS #
# Published 1 May - 30 Aug 1985 #
#####
#
```

This list contains all Vilspa papers that have appeared between the above dates in major refereed journals (Mon. Not. R. astr. Soc., Astron. Astrophys., Astrophys. J.) and which originate from Europe. While the origin of the data is the main criterion for inclusion in this list, the affiliation of the authors is also taken into consideration. Underlining of an author's name indicates membership of the Vilspa Observatory staff, and papers by Observatory staff on topics not involving IUE data are marked by '(Obs)' after the entry.

We remind users that, in any publications resulting from IUE data, whether it be from their own allocated shifts or data released from the Archive, they should acknowledge the use of the IUE Satellite and the Agency - ESA, NASA or SERC as appropriate, in a footnote on the title page. The following are examples of some of the possibilities.

Based on observations by the International Ultraviolet Explorer, collected at Villafranca Satellite Tracking Station of the European Space Agency. (In the case of one's own observations).

Based on data from the International Ultraviolet Explorer, de-archived from the Villafranca Data Archive of the European Space Agency. (In the case of archive data).

EDITOR'S NOTE

Due to problems of supply of Astrophysical Journal we have been unable to include IUE publications from this journal in the present issue of the IUE Newsletter. We hope to be able to publish the backlog in our next issue.

# MERGED LOG OF IUE OBSERVATIONS #
# 1 MAY 1985 - 30 SEPTEMBER 1985 #
#####
#
```

The merged log of Vilsta and Goddard images for the above dates is listed in order of right ascension. (For non-standard images the information given can be incomplete.)

The programme reference codes (column 1) identifying the ESA and NASA programmes for the seventh round can be found in ESA IUE Newsletter No.19 p17 and p23 for ESA and NASA respectively, and for the eighth round in ESA IUE Newsletter No.23 p11 and 17.

The Object Classification Codes (column 3) and the Vilsta Exposure Classification Codes (column 16) are listed overleaf.

CLASSIFICATION OF OBJECTS USED IN THE JOINT ESA/SERC LOG OF IUE OBSERVATIONS
#####

00	SUN	50	R, N OR S TYPES
01	EARTH	51	LONG PERIOD VARIABLE STARS
02	MOON	52	IRREGULAR VARIABLES
03	PLANET	53	REGULAR VARIABLES
04	PLANETARY SATELLITE	54	DWARF NOVAE
05	MINOR PLANET	55	CLASSICAL NOVAE
06	COMET	56	SUPERNOVAE
07	INTERPLANETARY MEDIUM	57	SYMBIOTIC STARS
08	GIANT RED SPOT	58	T TAURI
09		59	X-RAY
10	W C	60	SHELL STAR
11	W N	61	ETA CARINAE
12	MAIN SEQUENCE O	62	PULSAR
13	SUPERGIANT O	63	NOVA-LIKE
14	OE	64	STELLAR OBJECT NOT INCLUDED ABOVE
15	OF	65	MISIDENTIFIED TARGETS
16	SD O	66	INTERACTING BINARIES
17	WD O	67	
18		68	
19	UV-STRONG	69	
20	B0-B2 V-IV	70	PLANETARY NEBULAR+CENTRAL STAR
21	B3-B5 V-IV	71	PLANETARY NEBULAR-CENTRAL STAR
22	B6-B9,5 V-IV	72	H II REGION
23	B0-B2 III-I	73	REFLECTION NEBULA
24	B3-B5 III-I	74	DARK CLOUD (ABSORPTION SPECTRUM)
25	B6-B9,5 III-I	75	SUPERNOVA REMNANT
26	BE	76	RING NEBULA (SHOCK-IONISED)
27	BP	77	
28	SDB	78	
29	WDB	79	
30	A0-A3 V-IV	80	SPIRAL GALAXY
31	A4-A9 V-IV	81	ELLIPTICAL GALAXY
32	A0-A3 III-I	82	IRREGULAR GALAXY
33	A4-A9 III-I	83	GLOBULAR CLUSTER
34	AE	84	SEYFERT GALAXY
35	AM	85	QUASAR
36	AP	86	RADIO GALAXY
37	WDA	87	BL LACERTAE OBJECT

39	COMPOSITE	89	
40	F0-F2	90	INTERGALACTIC MEDIUM
41	F3-F9	91	
42	FP	92	
43	LATE TYPE DEGENERATE STARS	93	
44	G (TO 1FEB79); GIV-VI (FROM 1FEB79)	94	
45	G I-II (FROM 1FEB79)	95	
46	K (TO 1FEB79); K IV-VI (FROM 1FEB79)	96	
47	K I-III (FROM 1FEB79)	97	
48	M (TO 1FEB79); M DWARFS (FROM 1FEB79)	98	WAVELENGTH CALIBRATION (NASA LOG)
49	M I-III (FROM 1 FEB79)	99	NULS AND FLAT FIELDS (NASA LOG)

THE CLASSIFICATION IS SUPPLIED BY D STICKLAND FOR USE ONLY WITHIN THE PROJECT

EXPOSURE CLASSIFICATION CODES

#####

The exposure levels of Vilspa images are described by a 3-digit code listed in column 16 in the merged log.

DIGIT 1: EXPOSURE LEVEL OF CONTINUUM
DIGIT 2: EXPOSURE LEVEL OF EMISSION LINES
DIGIT 3: BACKGROUND LEVEL

The CONTINUUM and EMISSION are both classified as follows:-

0: NOT APPLICABLE
1: NO SPECTRUM VISIBLE
2: FAINT SPECTRUM: MAX DN < 20 ABOVE LOCAL BACKGROUND
3: UNDERRPOSED: MAX DN < 100 ABOVE LOCAL BACKGROUND
4: WEAK: MAX DN BETWEEN 100 AND 150 ABOVE LOCAL BACKGROUND
5: GOOD: NO SATURATION BUT MAX DN OVER 150 ABOVE LOCAL BACKGROUND
6: A BIT STRONG: A FEW PIXELS SATURATED
7: SATURATED FOR LESS THAN HALF THE SPECTRUM
8: MOSTLY SATURATED BUT SOME PARTS USABLE
9: COMPLETELY SATURATED

The BACKGROUND is classified in terms of a standard region of each camera outside the area affected by the high resolution orders. The value used is the mean DN given by a subset histogram approximately 10 pixels in width.

The BACKGROUND classification codes are:- (limits inclusive)

0 DN<20
1 21<DN<30
2 31<DN<40
3 41<DN<50
4 51<DN<60
5 61<DN<70
6 71<DN<80
7 81<DN<90
8 91<DN<100
9 DN>101
X SATURATED

NOTES

- 1) No exposure classification code was assigned to VILSPA images before 1 August 1978.
- 2) Prior to 1 Sept 1979, the BACKGROUND digit was not included and the ECC occupied the first two places in the comment line.
- 3) The Goddard images are described in the comments by the gross DN of the CONTINUUM (C), EMISSION LINES (E) and BACKGROUND (B).
