

INTERNATIONAL ULTRAVIOLET EXPLORER

THREE AGENCY

INFORMATION INTERCHANGE

OCTOBER 1985

INTRODUCTION

The International Ultraviolet Explorer (IUE) satellite system is a cooperative program among the European Space Agency (ESA), the United Kingdom's Science and Engineering Research Council (SERC), and the United States National Aeronautics and Space Administration (NASA).

Observations using the spaceborne telescope are made for sixteen hours each day from the observatory at NASA's Goddard Space Flight Center near Washington, DC, in the United States; and for eight hours each day from the ESA observatory facility at Villafranca del Castillo, near Madrid, Spain.

Day to day functioning of the system, as well as dissemination of the scientific data obtained from it, require that considerable information must be exchanged among the three agencies involved.

Since the beginning of the IUE program, the required information exchanges have evolved to meet changing needs. Much has been documented, some has not. As a result, it was decided at the "Three Agency Meeting" at Villafranca del Castillo in November 1979, that NASA would assume the responsibility of compiling a document to define the required information exchanges. The document would be supplied to the IUE management of ESA and SERC for their comment and agreement.

In the years between 1979 and 1984 extensive "red line" modification was incorporated into the document. This new release includes all the informal changes plus some formal modifications. As with the original release, its acceptance by the three agencies is indicated by the signatures on the "Concurrence" page.

CONCURRENCES

This document identifies the operational and data information products which are exchanged among the United Kingdom's Science and Engineering Research Council, the European Space Agency, and the United States National Aeronautics and Space Administration as part of the International Ultraviolet Explorer program and, where appropriate, defines the form of those information products.

It is agreed that any changes in those products, or the form thereof, will be implemented only by a mutually approved correction or supplement to this document.

OBSERVATORY SCHEDULES

The observatory schedules are made so that a program is chosen for the dates on which a minimum number of its targets are in the solar avoidance region and the Beta=55-95 degrees zone (hot OBC). However, the observatory will attempt to honor requests to schedule operations on specific dates to allow the Guest Observers to cover desirable phases of variable stars, to utilize favorable planet-satellite configurations or to carry out simultaneous observations at other wavelengths etc. At GSFC the schedules are published at least three months in advance. The date, starting time of each shift, Principal Investigator's name, his program identification code and the names of the Resident Astronomers and Telescope Operators on duty are listed on the schedule.

ESA Observatory schedules are prepared for six-month intervals. The VILSPA operational schedules are prepared monthly.

starting on April first. It is under continuous
review.

ARCHIVAL DATA

At both the GSFC and VILSPA ground facilities, raw data taken from the spacecraft are operated upon to make required corrections and calibrations. The processed data are then recorded and delivered to the observers.

1600 bpi copies of the archival tapes are prepared and sent to the National Space Science Data Center at GSFC.

The NSSDC processes the incoming tapes to high-density, blocked (VBS format) tapes, at 6250 bpi for storage.

The 6250 bpi tapes containing the data acquired at GSFC are duplicated for the SERC and ESA. The 6250 bpi tapes containing the data acquired at VILSPA are duplicated for the SERC.

The NSSDC and the ESA and SERC data centers send copies, at the requested bpi, of GSFC and/or VILSPA archival tapes to requesters, within the limitation that no Guest Observer's data may be given to anyone else until the original Guest Observer has had exclusive access to it for at least six months. At GSFC the six-month rule is interpreted as being six months and 20 days from the completion of the Guest Observer's data package. At VILSPA the six-month rule is interpreted as being six months from the first of the month subsequent to dispatch.

The formats of the archival tapes are shown in Appendices A, B, & C.

LOGS

Logs are maintained at both observatories. These logs list the object observed, the Guest Observer's program identification code, position, comments, exposure times etc. for each observation made with the IUE. The logs are distributed by GSFC to the scientific communities associated with GSFC, ESA, and the SERC.

Distributed logs contain a footnote stating that releasable observations will be available upon request to the data centers. With the addition of that footnote, the observatory log fulfills the requirement for publication of a list of IUE observations available at the data centers, as required by the memorandum of understanding.

The printed merged logs explicitly flag all observations which are not releasable on the day of generation with an asterisk in the field immediately adjacent to the date of processing. This field may also contain some of the following pieces of information. Images that are available from the data centers only as raw data are flagged with an R and images for which data have been lost and are not available from the data centers are flagged with an L. At times, an image is reprocessed by the station that did not acquire it and the resulting data are archived. These images are flagged with the first letter of the processing station (G or V) (e.g. an image originally acquired at VILSPA and for which the data centers contain data processed at GSFC, would be flagged with a G).

The agencies have agreed to guarantee the accuracy of certain critical fields and have agreed upon defaults for these fields. This information has been included as part of Appendix G.

At VILSPA, the ESA and SERC observations are combined into a VILSPA Observatory Log. At GSFC IUESOC, the GSFC and VILSPA Observatory logs are merged into a composite log.

Observatory logs generated at GSFC are sorted by one of three primary sorts: right ascension, object classification or time of observation. Logs sorted by right ascension have successive subordinate sorts by program identification, time of observation, camera, image sequence number and object class. Associated with logs sorted by right ascension are logs containing solar system objects (object classes one through nine). Solar system logs are sorted by object class with successive subordinate sorts by object name, time of observation, camera and image sequence number. Logs sorted by object classification have successive subordinate sorts by right ascension, day of observation, camera and image sequence number. Logs sorted by time of observation have successive subordinate sorts by camera and image sequence number.

The overall schedule for major observatory logs and the merged log is shown on the next page. The annual merged log production is keyed to observational epochs of one calendar year beginning each April.

LOGS ORIGINATING AT GSFC				
	TIME PERIOD	PREPARE & DIST.	PRIMARILY SORTED BY	CONTAINS
GSFC Monthly Log to ESA and SERC (Text)	One Month	Monthly	1) Time of Observation 2) Right Ascension	One Months Worth of GSFC Images
GSFC Log to ESA (VILSPA) (Tape)	Cumulative from Launch to Previous Month	Monthly	Time of Observation	File 1-GSFC Images Only File 2-VILSPA Images Processed at GSFC

AND FREQUENCY: Mail, annually in May

ADDITIONAL INFORMATION: Logs are cumulative from launch through March 31. One tape contains four files: file one contains the general log preface; file two contains all non-solar system objects sorted by right ascension; file three contains a brief preface for solar system objects; file four contains solar system objects. The second tape contains two files: file one contains the general log preface; file two contains all objects sorted by object classification. Images on one listing and set of microfiche are sorted by right ascension, except for solar system objects (object class 01-09), which are listed separately at the end. Images on the second set of microfiche and listing are sorted by object classification.

ADDITIONAL INFORMATION:

SPECTRAL IMAGE PROCESSING SYSTEM

The IUE Spectral Image Processing System (SIPS) is updated at both ground stations, based upon the information exchanged between them.

The original SIPS package was developed at GSFC and provided to VILSPA for installation and use at that site.

The two image processing systems (GSFC and VILSPA) are maintained functionally equivalent. This functional equivalence of the two systems is checked on a roughly annual basis by performing byte-to-byte comparison of the output produced by identical images processed at the two installations.

Updates to the IUESIPS application programs are coordinated between both stations and implemented independently at the two locations. Changes affecting IUESIPS output products are documented in the Chronology of Modification to IUESIPS Output Products; changes affecting IUESIPS output tapes are documented in more detail in the Time History of IUESIPS Configurations. These documents are coordinated between both stations and are available to IUE Guest Observers via the NASA and ESA IUE Newsletters.

ADDITIONAL INFORMATION:

OPERATIONS SOFTWARE CHANGES

The IUE operations software system is designed, tested, and placed into operation at GSFC. When it is declared satisfactory for operations, it is supplied to VILSPA for adaptation to their hardware configuration. As new (updated) systems are built, complete deliveries are made to VILSPA. The following are contained in each system delivery:

a. Magnetic Tapes

1. Database source tape at 1600 bpi, reflecting the current level used in the system build.
2. Source and binary tapes at 1600 bpi, all files.
3. Miscellaneous Items

- (a) Listing of SYSGEN deck
- (b) One-liner program descriptions
- (c) Memo describing system changes and Operations Manual updates.

The operations software system changes are controlled by the use of "Configuration Change Request" (CCR) and "Discrepancy Report" (DR) forms. These forms are numbered sequentially by IUEOCC and supplied to the software contractor for implementation. A review committee of GSFC operations and software development personnel reviews the CCRs and DRs periodically to establish priorities for implementation and status review. Copies of CCRs, DRs, and the priority list are provided to VILSPA. VILSPA inputs to the CCRs, DRs, and priority list are coordinated informally.

Operations Procedures (PROCs) software are also maintained at GSFC and delivered to VILSPA on computer magnetic tape. These procedures are updated as required by the IUE operations personnel. VILSPA provides inputs to GSFC on any PROC changes they desire. When the PROC files have been modified and fully tested, they are released to both the IUEOCC and VILSPA for operations.

FLIGHT OPERATIONS MANUAL

Day-to-day spacecraft operations by two ground stations requires that standard operating procedures need to be maintained and events should be reported in a timely manner.

The Flight Operations Manual (FOM) provides a major single-reference source for IUE operations policy, Flight Operations Directives (FODs), the IUE spacecraft telemetry and command handbook, and other operation information. The FOM was published by GSFC and is updated as required. The FOD's are updated routinely and are distributed to the operating locations as major operating instructions are changed. Spacecraft anomaly reports for reporting anomalous events are issued as needed. Handover information at the time spacecraft command is exchanged between stations assures safe and efficient daily operations.

APPENDIX I

VILSPA OBSERVATORY LOG TAPE FORMAT

VILSPA DATA BASE TAPE FORMAT

Ref: IUE Data Bank - Interchange Rules 2.1.B

The tape contains 1 file composed of 256 byte records. The code is EBCDIC. 16 records per tape block. Blocksize 4096 bytes. Each record is subdivided as follows:

<u>Bytes</u>	<u>Description</u>	<u>Default</u>
1-8	Date of Observation (YYMMDDHH).	Zeroes
9-9	Camera Nr.	"
10-14	Image Nr.	"
15-16	Apertures (S or/and L).	Blanks
17	Dispersion (H or L).	"
18	Large Aperture Status (O & C).	Open
19	Exposure Mode (T & M).	Blank
20	Reprocessing Nr.	Zeroes
21-26	Processing Date.	"
27-32	Release Date.	"
33-38	Exposure Start of Small Aperture.	"
39-44	Exposure Duration of Small Aperture.	"
45-50	Exposure Start of Large Aperture.	"
51-56	Exposure Duration of Large Aperture.	"
57-59	Exposure Classification Code.	Blanks
60-60	Observing Station (G or V).	"
61-61	Release Flag (* if released).	Blank
62-64	Free.	Blanks
65-69	Program ID.	"
70	Processing Station.	"
71-80	Object ID.	"
81-90	Homogeneous Object ID.	"
91-92	Object Type	None
93-99	Right Ascension (HHMMSS).	Zeroes
100-105	Declination (HHMMSS).	"
106-106	Sign of Declination.	Blank
107-111	THDA.	Blank
112-116	FES Counts.	Zeroes
117-118	FES Tracking Mode.	Blank
119	Camera.	Zero
120-123	Internal D.B. Control Characters.	Blank
124-127	Magnitude in Hundredths.	9999
128	Sign of Magnitude.	Blank
129-187	Comments (3 1st. bytes = ECC of Small)	Blanks
188-192	Free. in case of both	"
193-206	Observer's Name.	Blanks
207-212	Tape ID.	"
213-215	File Start.	Zeroes
216-218	File End.	"
219-224	Sending Date to VILSPA.	"
225-240	Archive Comments.	Blanks
241-243	Internal Code to D.B.	"
244-255	Free.	"
256	Internal Code to D.B.	Blank

APPENDIX J

VILSPA OBSERVATORY LOG PRINTOUT FORMAT

VILSPA OBSERVATORY LOG TAPE FORMAT

The tape contains 1 file composed of 132 byte records. The code is ASCII. 16 rec. per tape block. Block size 2112. Each record is subdivided as follows:

<u>Bytes</u>	<u>Description</u>
1 - 4	Blanks
5 - 9	Program ID
10 - 10	Blank
11 - 20	Object ID
21 - 21	Blank
22 - 23	Object Class
24 - 24	Blank
25 - 29	Magnitude
30 - 30	Blank
31 - 34	Right Ascension (HH.MM)
35 - 35	"." (Point)
36 - 38	Right Ascension (SSS)
39 - 39	Blank
40 - 40	Sign of Declination
41 - 44	Declination (DD.MM)
45 - 45	"." (Point)
46 - 47	Declination (SS)
48 - 48	Blank
49 - 49	Dispersion (H or L)
50 - 50	Blank
51 - 56	Camera and Image Number (C>NNNNN)
57 - 57	Blank
58 - 59	Aperture (S or L)
60 - 60	Blank
61 - 61	Large Aperture Status (O = Open; C = Closed)
62 - 62	Blank
63 - 70	Date of Observation (YYMMDDHH)
71 - 71	Blank
72 - 77	Exposure Start of Small Aperture (HHMMSS)
78 - 78	Blank
79 - 84	Exposure Duration of Small Aperture (MMMMSS)
85 - 85	Blank
86 - 91	Exposure Start of Large Aperture (HHMMSS)
92 - 92	Blank
93 - 98	Exposure Duration of Large Aperture (MMMMSS)
99 - 99	Blank
100 -102	Exposure Classification Code
103 -103	Blank
104 -104	Station Code
105 -105	Blank
106 -132	Comments

Question about Solution	185	185	1
Completion Flag	186	186	1
Blanks	187	252	66

The tape contains 1 file composed of 252 byte records. 28 records per block. Block-size 7056 bytes. The code is EBCDIC.

APPENDIX K
DISCREPANCY LIST EXCHANGE RULES

IUE DATA BANK - INTERCHANGE RULES

1. Integrity and Correctness of Data Bank Records. Discrepancy List

- 1.1 Each Center is responsible for the integrity of their own records (i.e. Goddard for G records, VILSPA for V records).

Previous errors at each Center will be corrected by the originator (i.e. errors in G records will be corrected at GSFC, errors in V records at VILSPA). Freedom exists at each Center to perform corrections to their own records. These corrections do not need to be always reported. It is advised to do so for important cases, or when a great number of records are involved.

A dual flow of discrepancy reports/solutions will be established between both Centers:

- 1.2 Discrepancies, doubts, clarifications, errors, questions, etc., to VILSPA records originated at Goddard will be reported to VILSPA through the V-items of the Discrepancy List.

To each item VILSPA will propose a solution which, after an agreement is reached, will be implemented (VILSPA Data Bank Modification). Goddard will then receive the next copy of VILSPA Data Bank with the adopted solution already included.

- 1.3 Discrepancies, doubts, clarifications, errors, questions, etc., to Goddard records originated at VILSPA will be reported to Goddard through the G-items of the Discrepancy List.

To each item Goddard will propose a solution which after an agreement is reached, will be implemented (Goddard Data Bank Modification). VILSPA will then receive the next copy of Goddard Data Bank with the adopted solution already included.

APPENDIX K
DISCREPANCY LIST EXCHANGE RULES

2. Exchange of Information

2.1 Data Bank Interchange: Before the end of each month, each Center will dispatch to the other Center a magnetic tape containing:

a) From GSFC to VILSPA: two files:

1st. file: all Goddard Data Bank records (G records),
ordered by Observation Date;

2nd. file: all (cumulative) records of VILSPA images
reprocessed at Goddard, ordered by
Observation Date.

b) From VILSPA to GSFC: one file containing all V records
of VILSPA Data Bank.

2.2 Discrepancy List Interchange: Alternatively, and within a period determined by the needs, both Centers (GSFC and VILSPA) will interchange:

a) One magnetic tape containing all items (G-items and V-items)
of the Discrepancy List, ordered by Item Number.

b) Two listings of Non-completed Discrepancy List items:
one for G-items and one for V-items, ordered by Item Number.

APPENDIX K
DISCREPANCY LIST EXCHANGE RULES

3. Structure of the Discrepancy List

Applies to both the V-Items and the G-Items.

3.1 Each item will represent one image, with a unique identifiable item number.

3.2 Items will be numbered SMYYNNN, where:

S = the station of acquisition of the image;

MM = the month that the first list containing the
discrepancy was sent;

YY = the year that the first list containing the
discrepancy was sent;

NNN = a sequential number for each new item added to the
list within the month MM.

3.3 New items will be numbered ordered by reason for discrepancy.

Example: If there are 3 GSFC images for which object class is incorrect, 2 for which right ascension is incorrect, and 2 missing images added in November 83 to a list with 2 images still unresolved from the September 83 list (numbered items 24 and 25 on that September 83 list) which had right ascension incorrect, the items would be numbered:

G0983024	right ascension incorrect
G0983025	right ascension incorrect
G1183001	object class incorrect
G1183002	object class incorrect
G1183003	object class incorrect
G1183004	right ascension incorrect
G1183005	right ascension incorrect
G1183006	missing image
G1183007	missing image

APPENDIX K

DISCREPANCY LIST EXCHANGE RULES

- 3.4 The discrepancy list will be computerized. The format of the Discrepancy items is as follows:

Discrepancy List Data Base Format

	<u>Starting Column</u>	<u>Ending Column</u>	<u>Length</u>
Blank	1	1	1
Item Number	2	9	8
Station ID (where image was taken)	2	2	1
Month & Year Discrepancy initially was sent	3	6	4
Sequential Number	7	9	3
Blank	10	10	1
Camera (e.g. LWP)	11	13	3
Image Sequence Number	14	18	5
1st. Line of Disc. Description	19	38	20
2nd " " " "	39	58	20
3rd " " " "	59	78	20
4th " " " "	79	98	20
1st. Line of Proposed Solution	99	118	20
2nd. " " " "	119	138	20
3rd. " " " "	139	158	20
4th. " " " "	159	178	20
Discrepancy Type	179	179	1
Completion Date	180	184	5
Question about Solution	185	185	1
Completion Flag	186	186	1

The fields contain:

- . Discrepancy Type - 1 byte code to indicate type of discrepancy.
 - A = Acquisition Station uncertain.
 - C = Collaborative image
 - D = Double entries
 - M = Missing image number
 - N = Missing image at NSSDC
 - Q = Anomalous case
 - S = Science discrepancy
 - U = Unresolvable discrepancy
- . Completion Flag - 1 byte flag to indicate completion status of the discrepancy. When a discrepancy is solved, this flag is set equal to "C" so that future listings of non-completed discrepancies will not include this entry.

Also a "Question About Solution" byte has been included so that a question mark is printed when one station is uncertain about the proposed solution given by the other station.

APPENDIX K
DISCREPANCY LIST EXCHANGE RULES

4. Handling of the Discrepancy List

The handling of the Discrepancy List is performed in an alternate way (i.e. a sort of taken system whereby the updater of the DL is the Center which receives it).

The mechanization of this handling will be done as explained in the following chart (for a new G-Item):

VILSPA enters new G-item into DL, filling the fields:

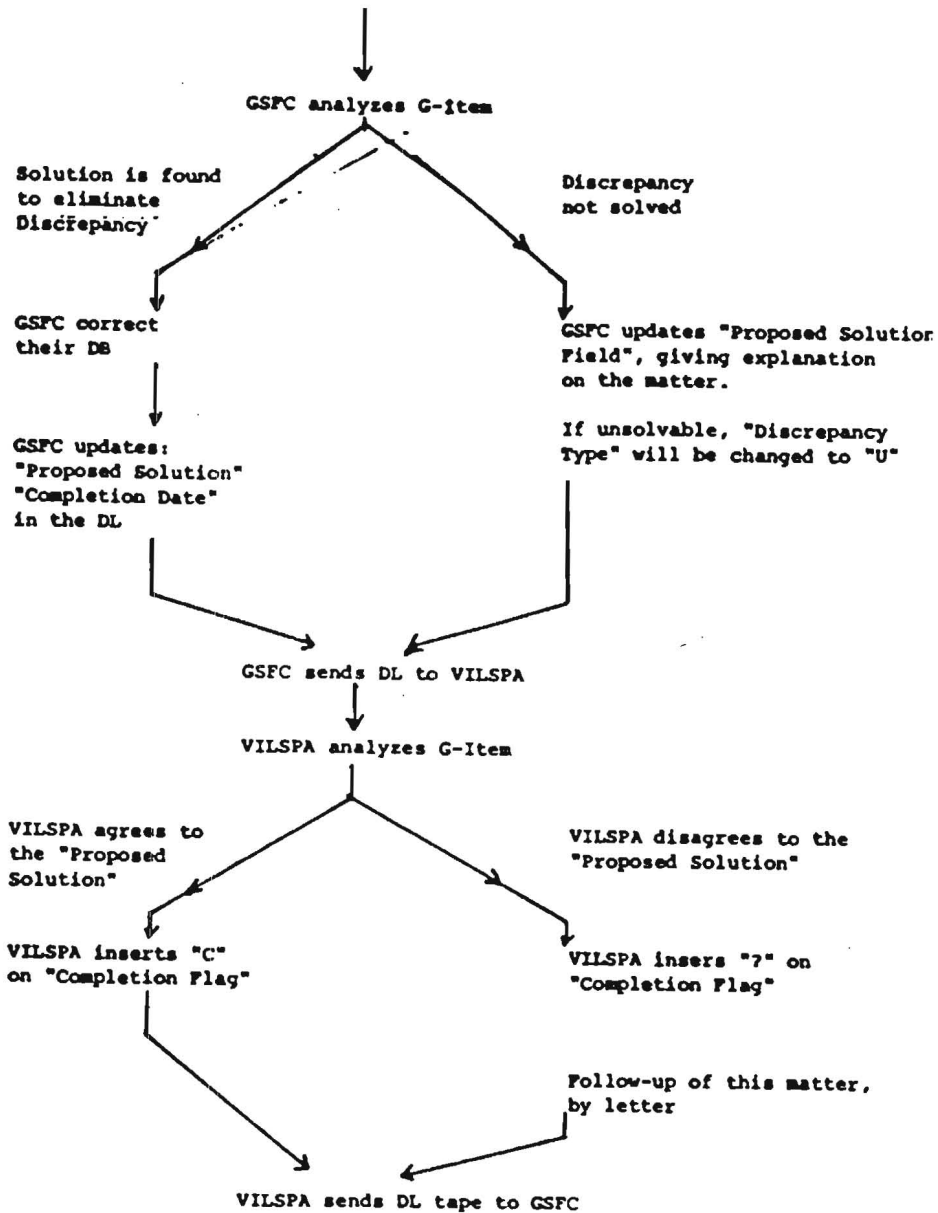

- a) Item Number
- b) Camera
- c) Image Sequence Number
- d) Discrepancy Description (4 lines)
- e) Discrepancy Type.

VILSPA sends DL tape to GSFC

↓
GSFC analyzes G-item:

↓

APPENDIX K DISCREPANCY LIST EXCHANGE RULES

The case if V-Items would be similar to the previous one, interchanging V by G.
