#### CONTROLLER'S MESSAGE

In early March, the 15th Anniversary of the launch of IUE was celebrated at VILSPA. This occasion also allowed the inauguration of the recently finished, future home of the ISO Observatory. Old timers shared this festive occasion with the current staff at VILSPA. Prof. Brendan Byrne and Prof. Klaas de Boer highlighted the importance of IUE for astrophysics in an enjoyable way for all those whose daily efforts in many areas at VILSPA, allow us to continue to use the extremely efficient IUE facilities.

In the meantime, the IUEAC has finished its deliberations and has overcome the difficulties presented by the challenge of the 2-year cycle allowed by the 16th Call for Proposals. Of the proposals submitted under the 2-year call, the IUEAC chose 35 to be judged under the special considerations for the 2-year proposals; the others were placed in the normal annual allocation process to compete with the proposals submitted only for the 16th year (see page 43).

On the operations side of the IUE Project many activities are taking place, some planned and others driven by the unexpected consequences of the long life of the Spacecraft in orbit.

In the Observatory at VILSPA we have seen in early January the replacement of the original Experiment Display Systems (EDS) by more modern control stations. Most likely before the start of the 16th episode these familiar machines will have definitely disappeared from the Observatory and users will have to get used to a "windowed" view of their results. As a consequence of this, the IUESIPS software for data reduction had also to be removed from the Telefile. This transition has been done smoothly, thanks to the good efforts of the staff involved. For the implications of this, please see page 17.

The difficulties associated with the scattered sunlight in the telescope (the "IUE Baffle Anomaly") have generated some operational problems, especially since the appearance of the associated "streak", which is mainly present at intermediate beta angles (see pg 8). Since additional care has to be applied to target acquisition and tracking, some decrease in efficiency has occurred, however only little (from 58% to 50%). To minimize the impact on the G.O. programs, we have implemented some new observation preparation procedures as the Users for May will have noticed on their schedule confirmation FAX. A somewhat earlier target screening -similar to that for Service

Observing- will prevent last minute problems. Also the scheduling process has been adapted to consider the Baffle Anomaly and minimize its impact.

Although no further problems are foreseen, we are currently planning to perform some Spacecraft tests to study the possibility of scattered light suppression for especially difficult observations.

On the side of the Final Archive, activities are accelerating now that the start of the IUEFA production of the VILSPA data is only a few days away. The long and extensive preparations are expected to pay off through a smooth, trouble-free and efficient cycle of processing. For the ULDA, version 4.0 has been delivered now to 22 National Hosts, serving scientists of 35 countries. In view of the success of the usage of the ULDA, a new version of the USSP is in preparation, allowing with host and end-users to function under UNIX type systems.

Willem Wamsteker

PERSONNEL CHANGES

-----

On 1st March 1991 Enrique Solano joined the Vilspa Image Processing Team (IPS), but his arrival at Vilspa was 2 years earlier when he started his doctoral thesis on delta Scuti pulsating variable stars. He graduated in Mathematics (branch of Astronomy) at Universidad Complutense de Madrid. He likes sports, especially tennis, football and athletics.

On 1st July 1992 Eva Suarez-Llanos joined the IPS team of Vilspa. Prior to this she worked here at Vilspa as an ISAS operator. She is a physics graduate (computer science branch) from the Universidad Complutense de Madrid. She is an ecology activist, is interested in Flamenco music and likes writing and travelling.

On 1st February 1993 Roberto Vio joined Vilspa as an ESA Research Fellow. He obtained his Ph.D. from the University of Padua in the subject of activity in galactic nuclei. Currently he is interested in the development of statistical techniques for the analysis of astronomical data and whilst at Vilspa he will be working on the analysis of the FES archive. He likes sports.

## IUE SPACECRAFT STATUS

March 1993

D. Hermoso, VILSPA

### 1. GENERAL

The spacecraft continued to support science operations normally and effectively in its sixteenth year of highly successful in-orbit operations. At the end of February 1993, a total of 24511 images had been collected from 10398 celestial objects (VILSPA only).

Although the light scattering phenomena, the so-called "scattered light" and the "streak", -most likely associated with the environmental aging of the spacecraft- are a matter of concern to the project, there are no indications that these will have immediate influence on the importance of the IUE as a scientific mission. The current situation is described in a separate article in this Newsletter.

### 2. POWER SUBSYSTEM.

IUE's 31th Eclipse Season ran from Jan. 15 to Feb. 12, 1993. The maximum depths of discharge for the season were 43.49% for battery 1, and 47.71% for battery 2.

Weekly top-offs continue for Battery #1 in order to force some charge current into the battery. At present Battery #1 is configured on its main charger, which limits the battery voltage to 24.72 volts. The charger is turned off and trickle resistors supply charge current to the battery. When the redline voltage of 25.84 V is reached the main charger is enabled and the battery voltage is again limited to 24.72V.

As far as the performance of batteries 1 and 2 is concerned, Battery 2 dominates and it supplied an average of 2.74% more power, at minimum voltage, than Battery 1.

### 3. SOLAR ARRAYS

The average yearly degradation from 1978-1992 was 3.31%. The largest degradation took place during the years 1988-1991. This increased degradation may have been a result of the solar cycle maximum. Despite their degradation, enough power is supplied by the arrays to keep the spacecraft power positive over the range of beta angles between 35° and 107°. This range is based on a nominal power requirement of approximately 145 watts.

#### 4. ATTITUDE CONTROL SYSTEM

Gyro 5 continues to show 0 amps of motor current since its sudden drop on February 5, 1991. The slope of Gyro 5's drift remains reasonably constant (-305.4 counts/sec on 26th Feb. 1993). Gyro 4 continues to perform nominally, maintaining a very stable drift rate. The nominal increase in gyro drift is associated with the degradation of the gyro's condition, while periodic fluctuations are thermally induced.

On 20 November 1992 the IUE spacecraft successfully executed a 9.78 seconds orbit adjustment Delta-V maneuver with all systems performing nominally.

Selecting the most favorable momentum-wheel unload jet firings to counteract the westward drift of the spacecraft continues to extend the duration of the IUE orbital drift period.

#### 5. THERMAL

In general the spacecraft temperatures remain stable.

OBC temperature operating limits were relaxed by eliminating the 55.8°C constraint zone; cooling of the OBC needs to take place only when its temperature glitches to 57.0°C.

The HOT OBC Beta region has changed as follows:

<u>MONTH</u>	<u>LOWER LIMIT</u>	<u>UPPER LIMIT</u>
JANUARY	65°	85°
FEBRUARY	70°	79°
MARCH	--	--
APRIL	--	--
MAY	--	--
JUNE	--	--
JULY	--	--
AUGUST	--	--
SEPTEMBER	--	--
OCTOBER	--	--
NOVEMBER	70°	79°
DECEMBER	65°	85°

## 6 . ANOMALIES

The IUE spacecraft has performed satisfactorily well over the last months, only a few anomalies were encountered:

- On Oct. 12, '92 at the end of a maneuver to beta = 48°, the error flag "register overflow in worker 0" appeared. The spacecraft was in Fine Sun Sensor (FSS) default mode. A dump of OBC telemetry showed that the error flag was caused by the calculation of an incorrect solar aspect angle (beta angle) by worker 0. This incorrect  $\beta$  angle was most probably caused by bad data coming from the FSS. The calculated  $\beta$  angle switched from its correct value of 48° to an incorrect value of 73°. The switch was only momentary and corrected itself immediately. When in FSS default mode, the pitch positional error is calculated using this  $\beta$  value and when it switched by such a large amount, worker 0 set the overflow error flag. At a  $\beta = 48^\circ$ , a dropout of the 5th coarse bit in the FSS pitch axis would have caused the false reading of  $\beta=73^\circ$ .
- On 11 Dec. the maneuver procedure stopped at 03:10z when telemetry did not confirm that worker 1 had received the data block 11 containing the slew information. The data block had been uplinked and confirmed by the ground system but the OBC failed to execute. The maneuver was re-calculated at 03:27z and uplinked successfully at 03:30z.
- On 14 Dec. a data block 17 to read-erase the LWP camera did not appear to execute. It appears the data block did not get into the OBC or interrupt 10 did not execute properly. The procedure was successfully repeated.

# The scattered light in the FES

Pedro M. Rodríguez Pascual

March, 1993

## 1 Introduction

Since November, 1992, IUE has suffered from an anomalous source of scattered light in the FES instrument (Teays, 1992). Here, anomalous means that it is not the diffuse scattered light detected since February 20th, 1991 (e.g., Monier, 1992; Weinstein and Carini, 1992a,b). Because the effect is confined to the lower right corner of the FES field, it is colloquially referred to as the "streak".

Since the "streak" appeared for the first time in IUE FES images, we have been collecting information that will help us to manage the situation during Real Time (R/T) operations. Although the phenomenon is not yet fully understood, we are able to predict when the "streak" will occur and, under some circumstances how to remove it or at least decrease it and, finally how to keep scientific programs running with the maximum efficiency.

## 2 Tests Results

After the appearance on a regular basis, some tests were made to establish the behaviour of the streak and to generate a predictive knowledge. The test strategy consisted in recording the FES counts at a point representative of the strength of the streak ( $X = -300, Y = -1400$ ) a) in a number of positions distributed all over the sky and b) during the slews from target to target. At each position, the FES counts at the Reference Point (R.P.) were measured as well. The sequence was repeated in order to check the consistency of the results.

These results can be summarized as follows:

- a) in general, the behaviour was found to be quite consistent,
- b) the intensity of the streak strongly varies along pitch maneuvers, but, in nearly all cases, no dependence was found with yaw maneuvers,<sup>1</sup>
- c) in general, the streak was weaker (or nearly absent) both at high and low  $\beta$  angles, with a dip around  $\beta = 75^\circ$  (see fig. 1 and 2).

<sup>1</sup> Along Yaw maneuvers  $\beta$  (the complementary angle between the Sun direction and the telescope axis) remains constant; Pitch maneuvers are those in which only  $\beta$  changes.

d) the  $\beta$  angle above which the streak vanishes is different when pitching up (moving to the Sun, increasing  $\beta$ ) or down (moving away the Sun, decreasing  $\beta$ ). The streak is present up to  $\beta = 99^\circ$  when pitching up but does not come back until  $\beta = 87^\circ$  when pitching down. At low  $\beta$ , the break always happens near  $\beta = 54^\circ$ , but below this, the streak intensity is highly variable.

These results show that the strongest dependence of the streak is with the  $\beta$  angle. Since November, 1992, we have been recording, at every telescope attitude, the FES counts at the R.P. and  $X=-300, Y=-1400$ . The streak shows in these data the same behaviour with  $\beta$  as found in the test maneuvers (Fig. 3): it is always present between 54 and  $85^\circ$ . The scattering of the points in figure 3 at low  $\beta$  is real in the sense that the streak can be weak or moderate; the scattering at high  $\beta$  is due mainly to the fact that coming from low  $\beta$  the streak is strong, but after a pitch up and down slew it decreases (see below). With the wider time coverage we have now, any strong dependence with the position or the phase of the Earth and/or the Moon seems to be ruled out (Fig. 4). Neither the shadow season #31 seems to have had any impact on the streak presence or intensity. FES images taken when the Sun was hidden to the IUE by the Earth, showed no streak at all, proving that the background light detected in the FES is solar radiation.

As mentioned above, the streak is characterized to fill in the bottom right hand corner of the FES field. However, the actual fraction of the field covered is not always the same; it runs from a narrow band near the edge to almost 2/3 of the whole field. In these cases, the background reaches the apertures and thus enters the spectrographs. Since the R.P. is near the apertures, the ratio of the FES counts at  $X=-300, Y=-1400$  and at the R.P. can be used as a guess of the amount of background light entering the spectrographs. Figure 5 shows that, in general, this is not very large unless the streak is very strong (larger than 7000 counts FO at  $-300, -1400$ ).

### 3 Normal Operations

The incidence of the streak on normal R/T operations can be divided in three issues: a) target acquisition, b) guiding and c) contamination of science spectra.

#### 3.1 Target acquisition

The presence of the streak in FES images obviously complicates the visual identification of the field; in the worst cases, only stars brighter than 7th magnitude can be clearly seen. Whenever there is a fair chance of the streak being present at the attitude of a not very bright target, its acquisition is done as a blind offset from a nearby bright star. If there is not such a nearby (nearer than  $1^\circ$ ) star, two blind offsets are needed: first, a coarse slew to a very bright ( $V < 7.0$ ) star, then, an offset to a second bright ( $V < 10.0$ ) star, and, finally, the offset to the target. In this case, a different reference point is used in the top left hand of the FES field, where there is no streak; given the high accuracy of fixed rate maneuvers with IUE ( $1''$ – $2''$ ), the second offset star will be found in the region out of

the streak. Thus, the net effect of the streak on target acquisition is only to increase the number of blind offsets, a very usual and reliable operation with IUE.

In the range  $87^\circ < \beta < 100^\circ$ , the tests carried out on December, 1991, showed that the strength of the streak was significantly lower when arriving from high  $\beta$  than coming from low  $\beta$ . So, if after a maneuver to a target in the mentioned  $\beta$  range from a lower  $\beta$  the streak is strong, we are able to reduce it by slewing up to  $\beta = 105^\circ$  and down back to the target. The intensity of the streak in the bottom right hand corner of the FES field is not only reduced, but its coverage of the field diminishes as well.

### 3.2 Guiding

For exposures longer than 15 minutes some guiding is normally needed to keep the target in the aperture. In the early days of IUE this was not a problem, since stars up to  $V=13$  were suitable to track on. After the appearance of the diffuse scattered light on 1991, the magnitude of guide stars was limited to 12. With the streak, the situation has become a bit more complicated, since it depends on both the magnitude of the guide star and the position on the FES. As the orientation of the field depends on the Roll angle, which changes with time, a possible guide which lies on the streak at a given epoch of the year, will be out of it at some other epoch when the Roll angle has changed. Since we can foresee when and where the streak will be, as well as the astronomical orientation of the FES field, we know where we have to look for guide stars. The Guide Star Catalogue has proved to be an extremely useful tool in preparing IUE observations.

Even in the case of no bright enough star is in the field (the FES can track on stars giving only 15% of the background counts), a long exposure can be done in "short" segments. Depending on the actual stabilization of the S/C, a target can remain well within the large apertures ( $10'' \times 20''$ ) up to 60 minutes without guiding.

### 3.3 Contamination of Long Wavelength (LW) spectra

In long LWP Low Resolution exposures, extended solar type spectra have been detected (Weinstein and Carini, 1992b). The DN level of this contamination is related to the total exposure time and the background near the apertures. A series of serendipity LWP exposures has been taken during the last months in order to analyse the spectral shape of the background spectrum and its relation to the FES background. These data are currently being analysed.

### 3.4 Open questions

Although the tests and normal operations have given us an acceptable understanding of the streak behaviour, providing the necessary guidelines to keep the impact on the scientific programs limited, the cause of this phenomenon is still unknown. It is, however, unambiguously established that the radiation has a solar spectrum and this will be most

likely related with problems in the light baffles in the telescope. Therefore, this is all referred to as the "IUE baffle anomaly".

New tests are planned to further reduce its operational impact and also various procedures are under consideration associated with the observation planning (schedule) and the observation preparation (training) to minimize the impact of this baffle anomaly on the IUE science program.

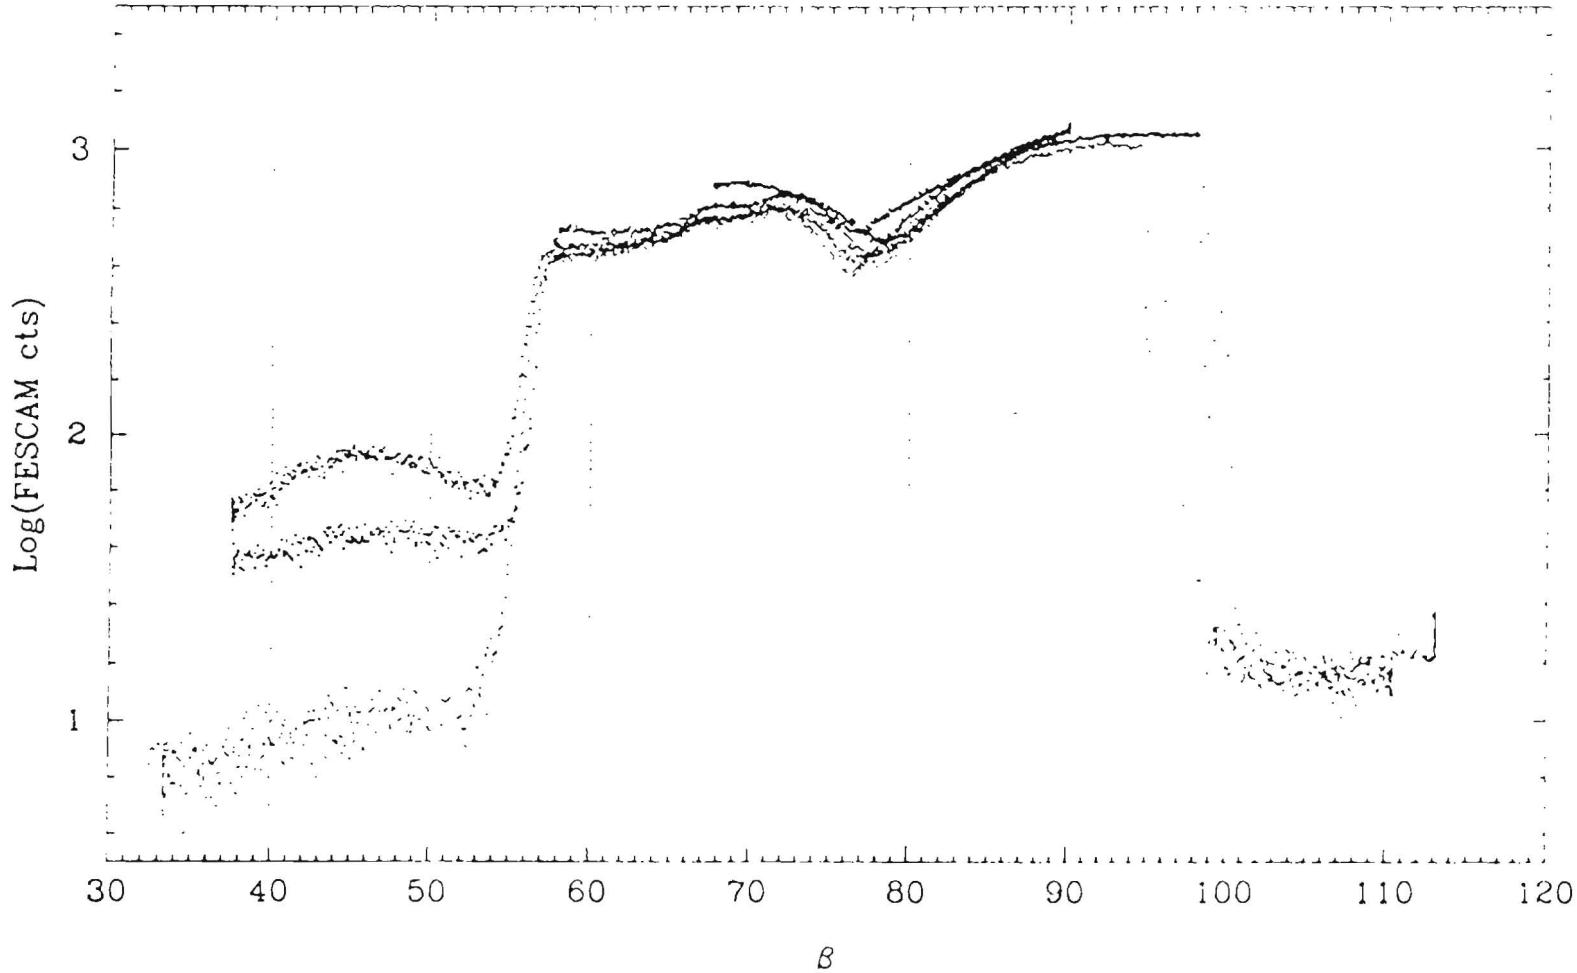

Fig. 1: FES (camera mode) counts (log scale) during pitch legs of maneuvers from low beta to high beta (pitching-up). This contains all data from 2 days testing (Dec. 1 and 2). All maneuvers on days 1 and 2 were identical.

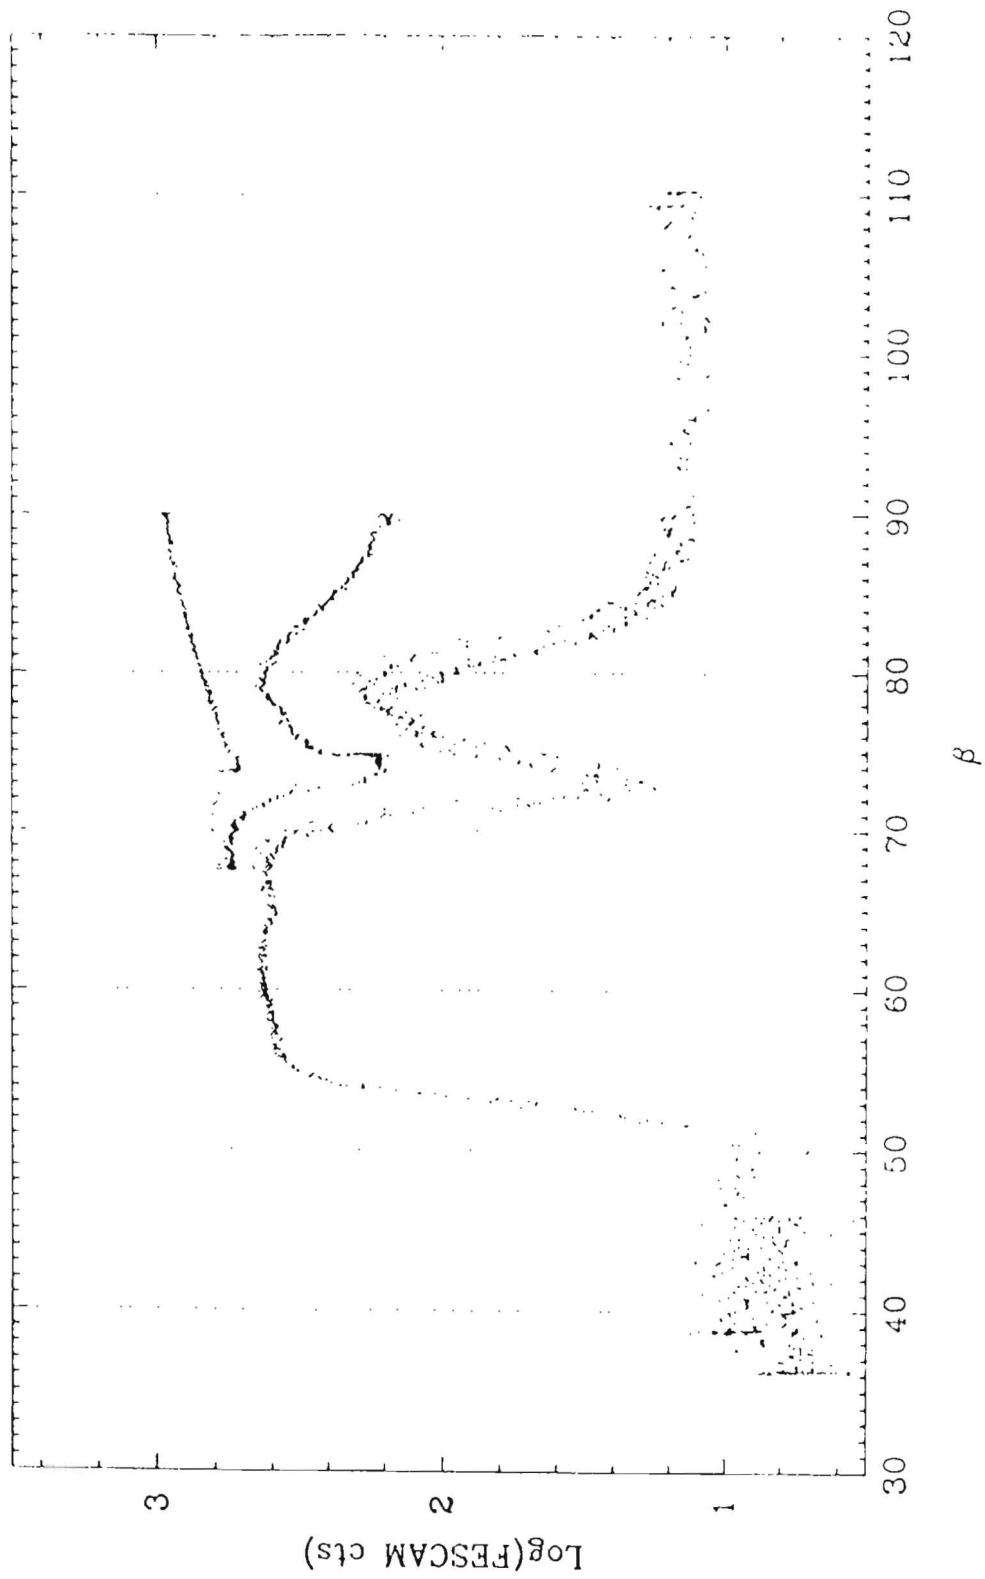

FIG. 2: Same as Figure 1, but only shows the pitch-down legs

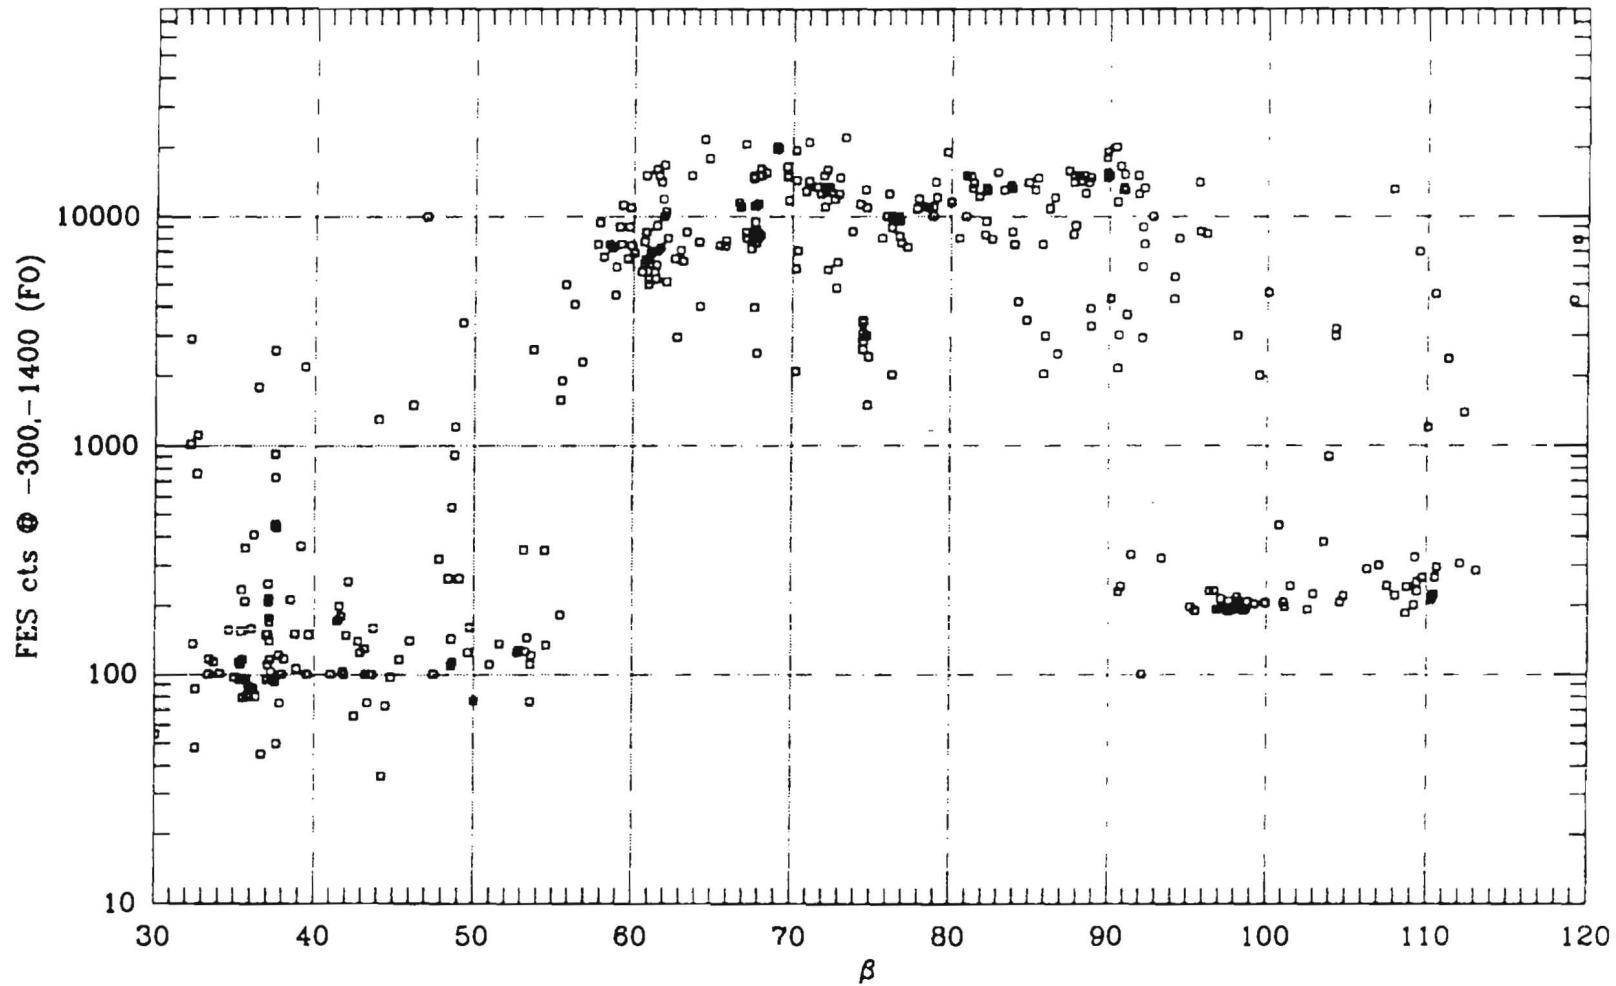

Figure 3: Equivalent to figures 1 and 2, but showing the streak intensity after the maneuver is complete instead of during the slew. It includes all data recorded since Nov. 1992. Note that  $cts_{FO} = 15 \times cts_{FESCAM}$ .

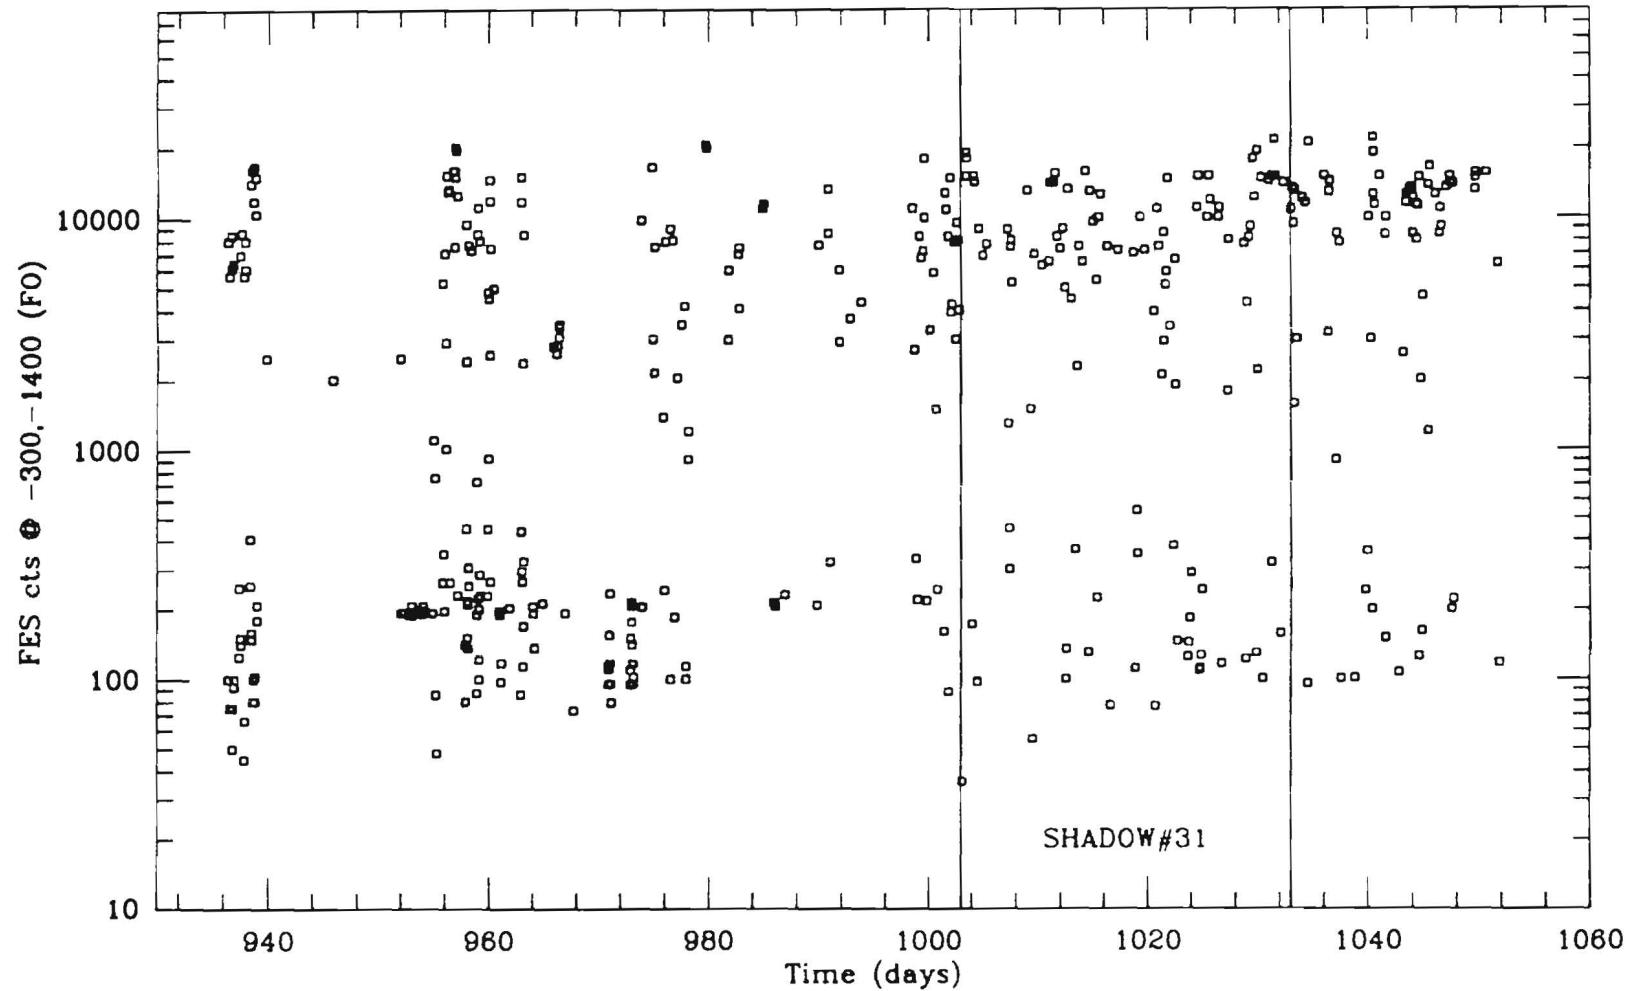

Figure 4: Although the streak seemed to appear at certain dates during earlier months, now, no dependence with time is found.

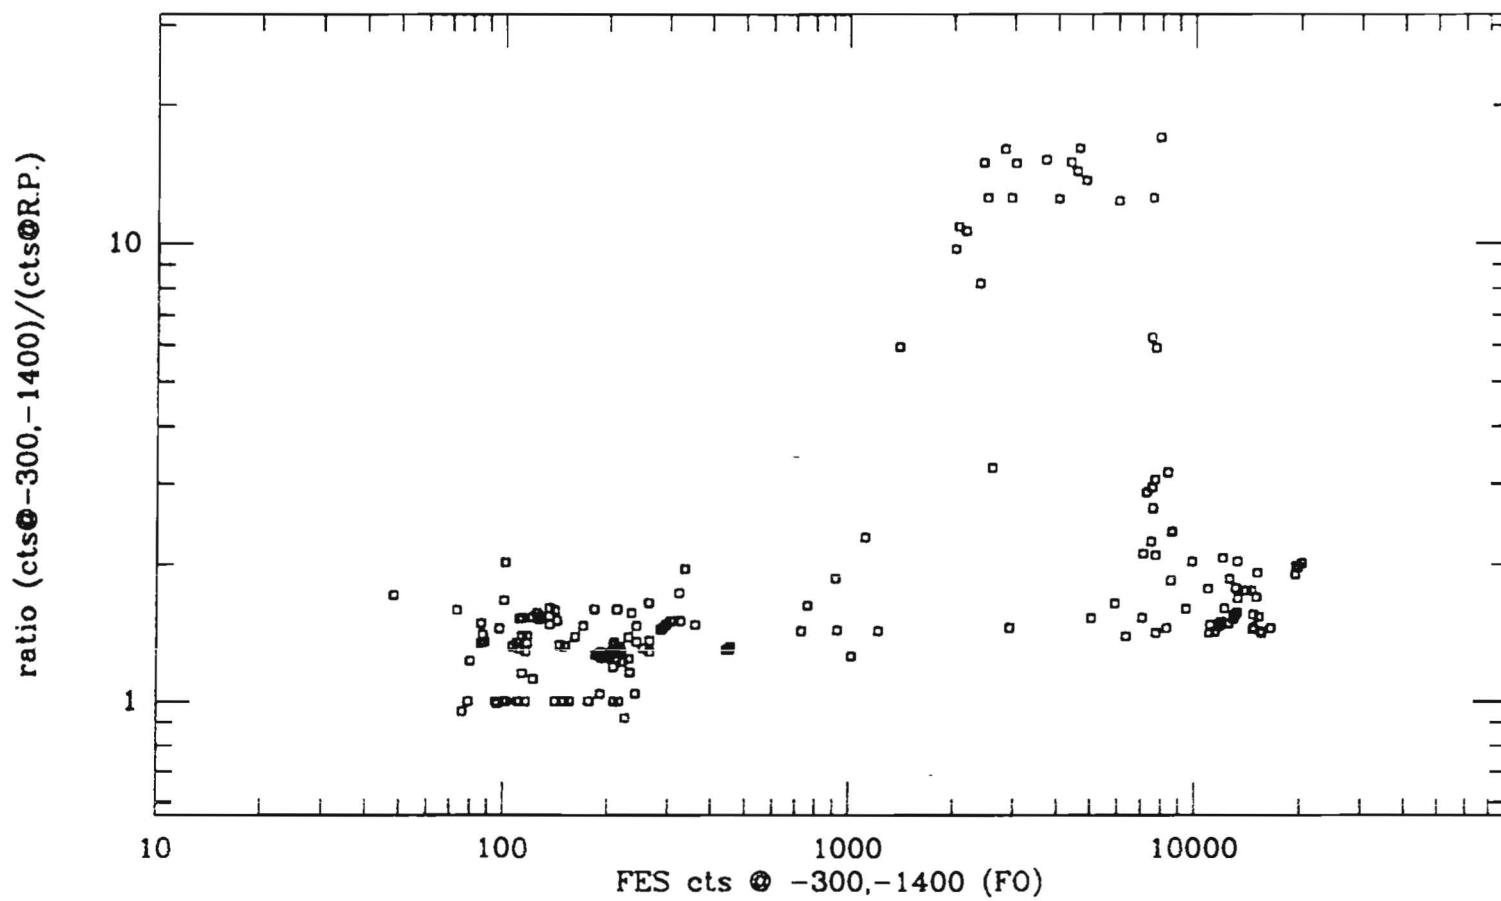

Figure 5: The extent of the streak in the FES (as represented by the ratio between the counts at  $X = -300$ ,  $Y = -1400$  and the counts at the R.P.) is shown against its intensity at  $X = -300$ ,  $Y = -1400$ . Points below 400 counts correspond to both low  $\beta$  angles (where the streak covers a large fraction of the field, even though it is weak) and high  $\beta$  angles (where the "normal" diffuse scattered background dominates). At intermediate  $\beta$ , the streak only reaches the apertures region when it is very strong (larger than 7000 counts FO). Points near 1000 counts (FO), correspond to a moderate intensity streak at low  $\beta$ .

## VAX-IUESIPS TRANSITION

D. de Martino and M. Barylak

IUE Observatory - VILSPA

On March 15, 1993 the standard IUE spectral image processing system (IUESIPS) will be moved from the old TELEFILE to VAX/VMS computers. This transition is necessary for the following reasons:

- due to the installation of new Telescope Operations Command Stations (TOCS) based on VAX VS3500 workstations, the daily image processing tasks can no longer be supported by the TELEFILE.
- GSFC has been running IUESIPS on VAX/VMS machines since Feb. 16, 1988. Adapting IUESIPS to the same environment eliminates the difficulties of implementing simultaneously upgrades to the IUESIPS software at both stations.
- finally, the migration has also been dictated by the fact that the final reprocessing of the entire IUE archive will be performed on VAX computers.

We have performed several tests to ensure that the compatibility requirements as defined by the IUE project are fulfilled. The tests showed that the outputs from IUESIPS on VAX are compatible with the ones of the TELEFILE. This is also true for the outputs obtained by the VILSPA VAX IUESIPS and the NASA VAX one. There is **no change** in the format of the IUE Guest Observer (GO) tape. The results of these tests are reported in Appendix A. These results indicate that there is normally **no need** to reprocess images processed at the TELEFILE in order to be comparable to images processed by VAX IUESIPS. IUE users are reminded that all reprocessing requests have to be scientifically justified in writing to the Observatory Manager. Reprocessing requests will be handled on a low priority basis with respect to both the operational processing and the IUE final archive reprocessing. As pointed out in Appendix A reprocessing will only be done under VAX IUESIPS.

As from **March 15, 1993**, options for output products, routinely provided to Guest Observers, will also slightly change. Specifically, CALCOMP plots will only be produced for high resolution images while low resolution plots will be provided in special cases only. Photowrites will continue to be produced for both resolution modes. Listings of low resolution fluxes will be suppressed. These changes are based

upon a statistical study of IUE output-product requests by Guest Observers over the last three years.

The transition of IUESIPS to the VAX will also imply a different work load for the Image Processing Specialists (IPS) and Computer Operators at VILSPA. As a consequence VILSPA GO tapes will be available to IUE users within **36 hrs** after the end of the shift whereas plots and photowrites will be delivered within **72 hrs**. Therefore IUE output products will be shipped to IUE users as a *standard procedure* starting March 15, 1993. IUE users visiting VILSPA who wish to pick up their tapes and output products personally before leaving VILSPA should plan their departure times accordingly.

For any further clarification IUE users are welcome to contact D. de Martino, responsible for IUESIPS at VILSPA (VILSPA::DDM) or M. Barylak, responsible for the IUE data base and archive (VILSPA::MB).

*Appendix A*  
**VAX-IUESIPS DATA TEST EVALUATION**

VAX/IUESIPS output data evaluation is based on the following items provided by Vilspa Computer Services (see VCS memo of 29/01/1993):

- 1- Output products from IUESIPS on TELEFILE (GO tape, label prints, photowrites and plots)
- 2 - Output products from IUESIPS on VAX (GO tape, label prints, photowrites and plots)
- 3 - Output products from IUESIPS on VAX from NASA (GO tape and label prints)
- 4 - Byte to byte comparison between processed images at NASA and VILSPA with IUESIPS on VAX.
- 5 - Report on test results from VCS.

The set of 6 images used for the test comprises of SW and LW, low and high dispersion and large and small aperture images and a trailed LWP low resolution one.

**1 - BYTE-TO-BYTE comparison**

Results of a byte-to-byte comparison, performed by VCS, have been produced by files containing the detected differences between the RAW, PI, ELBL, MELO and MEHI files as produced by IUESIPS on VAX at VILSPA and NASA. The detected differences, as also indicated in the test report, refer only to the image labels in the processing history portion and processing date and time with no differences in the scientific data.

**2 - Comparison of IUESIPS on TELEFILE and VAX**

**2a. IMAGES: HEADERS**

Differences are not critical as they refer to the scheme names and time of processing on above machines.

**2b. IMAGES: SCIENTIFIC DATA**

Pixel-by-pixel comparison between the products on the different computers has been performed by differences. For RAW, PI and ELBL, histograms of the difference images have been done while for MELO and MEHI files differences of wavelength, background, gross, net, rnet and fluxes have been performed and percentage deviations from the mean for each pixel has been computed.

2b1. RAW: Raw images are identical as from TELEFILE and VAX.

2b2. PI: For low and high dispersion, 99.8 % of the differenced images are within  $\pm 0.05$  FN. Few pixels have been found to be within  $\pm 3$  FN and a single pixel at 2000 FN on two images.

2b3. LOW DISPERSION:

WAVELENGTH: Difference of a step size ( $0.2 \text{ \AA}$ ) at selected wavelengths have been detected in both cameras. The VAX assigns  $\lambda$  1730.4, 2654.8, 2929.6, 3021.2 while TELEFILE assigns  $\lambda$  1730.2, 2654.6, 2929.4, 3021.0.

ELBL: 99.5 % of the differenced SWP images are within  $\pm 1$  FN with few pixels up to 30 FN. 99.3% of the differenced LWP images are within  $\pm 2$  FN with few pixels up to  $\pm 4$  FN. Regions of strong flux gradients, as those at the apertures, have the largest differences. 94.5% of the differenced trailed ELBL is within  $\pm 2$  FN with the largest differences at the borders of the trailing path. Few pixels have been found at 20,30 and 180 FN.

MELO: No differences have been found in the EPSILONS. NET flux differences for both cameras are within  $\pm 7$  FN ( $\sim 0.05\%$ ). Differences in single pixels of 70 - 100 FN have been found in a manual zero shift both aperture SWP image. This was also a low signal image. GROSS and BACKGROUND differences have been found within  $\pm 5$  FN ( $\sim 0.03\%$ ) with few cases at 9-13 FN. Trailed GROSS differences have been found within  $\pm 20$  FN. Single pixels at 110 FN and 280 FN have been found in the GROSS in the above mentioned SWP image and in the trailed one.

2b4. HIGH DISPERSION:

WAVELENGTH assignments differ of  $0.002 \text{ \AA}$  (one unit scale factor) ( $\sim 0.4 \text{ Km/s}$  for SWP and  $\sim 0.2 \text{ Km/s}$  for LWP cameras).

MEHI: Differences within  $\pm 5$  FN and  $\sim 10$  FN have been found in the NET and RNET fluxes respectively with differences up to 30-75 FN at the ends of the order respectively. BACKGROUND differences have been found within  $\pm 2$  FN ( $\sim 0.02\%$ ) while GROSS differ as much as  $\pm 5$  FN. Single pixels reaching 2000, 5000 or even 10000 have been found for both SW and LW cameras in the GROSS, BACKGROUND and NET differences.

2c. PHOTOWRITES AND CALCOMP PLOTS

No visible differences between VAX and TELEFILE image prints. Plots show a better visibility due to bigger characters and higher resolution.

### 3 - CONCLUSIONS

- 1 - The VAX-IUESIPS processing at VILSPA, as from par.1, is compatible with that of NASA.
- 2 - IUESIPS on VAX will produce differences in flux generally within  $\sim 0.05\%$  of the TELEFILE (see the summarizing attached table). The largest differences are found in very low signal spectra or regions of large flux gradients. These

differences are however below the IUE flux accuracy ( $\sim 10\%$ ) and well within the IUE Project acceptance standard for output compatibility. Wavelength assignments in the high and low dispersion spectra are below the resolution of the two modes. Differences are due to the truncation during real calculations in the TELEFILE while the VAX is a rounding machine.

- 3 - The above differences are compatible with those found in the  $\Sigma$ 9/VAX compatibility test done at NASA (NASA IUE NEWSLETTER, N.35,p.29), except for the wavelength assignments in the low dispersion mode. The latter differences, due to the implementation of dispersion constants in April 1988, have been detected in further compatibility tests performed between VAX and  $\Sigma$ 9 NASA IUESIPS outputs. Hence the compatibility requirements between VAX/TELEFILE/ $\Sigma$ 9 defined in the 3-Agency Meeting, Sept.88, are fulfilled.
- 4 - The differences between IUESIPS at NASA ( implemented on VAX since February 16, 1988) and at VILSPA, due to the different machines used, will disappear.
- 5 - In those cases that users wish to compare data acquired and processed at different times and hence with the two processing systems (TELEFILE and VAX) they can ask for reprocessing of old images with the VAX only.

**Summary of VAX/TELEFILE differences**

Image type	Quantity	Difference	Percentage of image	IUE Project Acceptance
RAW		0.0 DN	100.	0.0
PI				± 2 FN
		0.05 FN	99.8	
ELBL				± 9 FN

## ON THE ANALYSIS OF THE FES DATA

R. Vio,      W. Wamsteker

IUE Observatory, VILSPA, Spain

### Abstract

The FES light curves of two stars, HD332076 (A2,  $mv=9.3$ ) and HD204188 (A8m,  $mv=6.29$ ), obtained with the FES were analysed with the aim of ascertaining the possibility of using this instrument as a high-speed photometer in stellar variability studies.

### Introduction

The FES data with their high time resolution ( $\sim 100\ ms$ ) and their almost uninterrupted long sequences constitute a potentially powerful tool in studying rapid variability of stellar sources (Pike and Wamsteker, 1990). However, since this instrument has not been designed to work as a photometer, its real capabilities for such a task must be tested. For this reason the light curves of two stars, HD204188 and HD332076, characterized by about 10000 and 1000 counts per second, respectively, were investigated.

### HD204188

Fig. 1 shows the power spectrum of a sequence of 2000 points ( $\sim 200\ s$ ) extracted from the light curve of HD204188. A statistically significant peak at frequency 0.467 (in units of sampling frequency), corresponding to a period of  $\sim 0.22\ s$ , indicates the presence of a high frequency modulation in the data. This modulation, however, is not intrinsic to the source but it is due a difference in the zero-points of the X and Y pairs of the FES scan pattern (see Fig. 2). The position of the peak near, but not exactly at, 0.5 (the Nyquist frequency) means that the X Y scan alternation is not a strict one; in other words, sometimes it is possible to see two consecutive X or two consecutive Y values. This effect is due to the difference between the time arrival of the data from the satellite ( $51.2\ ms$ ) and the update of the FES values ( $96\ ms$ ), that determines the loss of a point approximately every 15 (Ojero, 1991). The consequence is that the X Y scan alternation in practice is characterized by a period slightly longer than the sampling period of the signal. Since in this case the time behaviour of the signal is not sinusoidal (only a sequence of + - + - + - can be considered a sinusoid, with frequency equal to the Nyquist frequency) the other peaks visible in the power spectrum can be interpreted as harmonics of this. The natural way of eliminating this spurious modulation is to separate the X and Y tracks. This procedure is advisable also because the the X data tend to be noiser than the Y data (Pike and Wamsteker, 1990). Fig. 3 shows the Power-Spectrum of the signal constituted by the Y data only (1000 points,  $\sim 200\ s$ ). The modulation at  $0.22\ s$  seconds and the corresponding harmonics are no longer present, but a new periodic modulation is visible at about 7 sec (in reality the width of the peak, which is larger than the minimum time resolution implies that the modulation

is a quasi-periodic process). The origin of such modulation, that can be easily mistaken as genuine, is more subtle. The explanation is linked to the errors in the tracking of the telescope. In effect, because of the small drifts of the satellite, the position of a star on the focal plane of the FES is not constant and must be continuously corrected. A different position means that the image of the star is sampled at different points, with consequent variations of the recorded counts. The correction can have a periodic character (Fig. 4a,b) and, consequently, the signal is modulated in the same way (Fig. 5). This interpretation is confirmed by Fig. 6, which shows the Cross-Correlation Function of the signal (Y data) and the quantity EY that gives the difference, along the Y scan direction, between the expected position of the star and the true one. The observed correlation is inverted if the EX quantity is considered (Fig. 7). The meaning of these results is that when the error along the Y direction is large the counts are higher, the opposite is true for the error along the X direction. This result implies, at least for the segment of time series considered here, a dependence between the EX and EY quantities, and more precisely when the correction EY is large in one sense the EX correction is large in the other one (Fig. 8). In spite of the statistical significance of the correlations, these cannot be used directly for the correction of the counts since it is their combination, and not their actual magnitude, that determines the spurious modulation of the signal. This effect is troublesome since in practice it limits the time resolution of the FES.

Other sources of errors for the FES photometry are the changes of focus and sky brightness which, although they can be approximated by means of smooth functions (e.g. polynomials), are not easy to remove (see Fig. 9a and Fig. 9b).

All these problems render problematic the reliable detection of possible small variations in the luminosity of a star on time scales of a few seconds. For the moment, assuming that the characteristics of the variability of a star are constant on time scales of some hours, the most reliable procedure for analysing the FES data appears the following:

- rebinning of the time series with a time step larger than the period characteristic of the fluctuations of the EX and EY quantities. In this way the influence of a spurious periodic modulation of the signal is reduced ;
- division of the time series in several sub-sequences;
- comparison of the results obtained from the statistical analysis of such individual sequences.

In the case of HD204188, using this procedure, it is possible to exclude the presence, on a time scale of about 4 hours, of a large amplitude, coherent variability with constant characteristic.

## HD332076

In the case of this faint star the situation is, in a certain sense, less difficult, since the noise is so high that it masks most of the problems found for HD204188. For example the Power-Spectrum (Fig. 10) of a sub-sequence of 2000 points ( $\sim 200s$ ) extracted by the original time series does not show the high frequency modulation due to the X and Y pairs of the FES scan pattern (compare with Fig. 1). Moreover the cross-correlation of the signal with the quantities EX and EY, although present, is weak. Only the power spectra of EX and EY and their cross-correlation are similar to those found in the case of HD204188. Also for this object the statistical analysis carried out according to the procedure above described permits to exclude the presence of a coherent variability with constant characteristic on a time scale of about 4 hours.

## Conclusions

At this stage a reliable analysis of the FES data appears not to be simple: the influence of factors on time scales from some seconds to some minutes make problematic the identification of possible small amplitude modulations of the signal. Moreover, from this study it appears that it is not possible to analyse the FES time series without taking into account the sequence of the EX and EY errors.

### PROPOSAL STATISTICS

The table below shows the breakdown of Applications for IUE time according to category (Q, E, A, etc.) and according to whether it is a 1 year or 2 year proposal. for comparison last year's Applications are shown in the end column.

MERGED LOG OF IUE OBSERVATIONS

1 JUNE 1992 - 31 DECEMBER 1992

The merged log of VILSPA and Goddard images for the above dates is listed in order of right ascension. (For non-standard images the information given can be incomplete).

The Object Classification Codes (column 3) and the VILSPA Exposure Classification Codes (column 16) are listed overleaf.

CLASSIFICATION OF OBJECTS USED IN THE JOINT ESA/SERC LOG OF IUE OBSERVATIONS

THE CLASSIFICATION IS SUPPLIED BY D STICKLAND FOR USE ONLY WITHIN THE PROJECT

## EXPOSURE CLASSIFICATION CODES

---

The exposure levels of Vilspa images are described by a 3-digit code listed in column 16 in the merged log.

DIGIT 1: EXPOSURE LEVEL OF CONTINUUM  
DIGIT 2: EXPOSURE LEVEL OF EMISSION LINES  
DIGIT 3: BACKGROUND LEVEL

The CONTINUUM and EMISSION are both classified as follows:-

0: NOT APPLICABLE  
1: NO SPECTRUM VISIBLE  
2: FAINT SPECTRUM: MAX DN < 20 ABOVE LOCAL BACKGROUND  
3: UNDEREXPOSED: MAX DN < 100 ABOVE LOCAL BACKGROUND  
4: WEAK: MAX DN BETWEEN 100 AND 150 ABOVE LOCAL BACKGROUND  
5: GOOD: NO SATURATION BUT MAX DN OVER 150 ABOVE LOCAL BACKGROUND  
6: A BIT STRONG: A FEW PIXELS SATURATED  
7: SATURATED FOR LESS THAN HALF THE SPECTRUM  
8: MOSTLY SATURATED BUT SOME PARTS USABLE  
9: COMPLETELY SATURATED

The BACKGROUND is classified in terms of a standard region of each camera outside the area affected by the high resolution orders. The value used is the mean DN given by a subset histogram approximately 10 pixels in width.

The BACKGROUND classification codes are:- (limits inclusive)

0 DN<20  
1 21<DN<30  
2 31<DN<40  
3 41<DN<50  
4 51<DN<60  
5 61<DN<70  
6 71<DN<80  
7 81<DN<90  
8 91<DN<100  
9 DN>101  
X SATURATED

## NOTES

---

- 1) No exposure classification code was assigned to VILSPA images before 1 August 1978.
- 2) Prior to 1 Sept 1979, the BACKGROUND digit was not included and the ECC occupied the first two places in the comment line.
- 3) The Goddard images are described in the comments by the gross DN of the CONTINUUM (C), EMISSION LINES (E) and BACKGROUND (B).

An extremely active giant star: HD 218153

de Winter, D., Perez, M.R., Hu, J.Y., The, P.S. 1992, A&A, 257, 632.  
A study of the optical and ultraviolet spectral characteristics  
and of the circumstellar material around the new luminous blue  
variable WRA 751

Deleuil, M., Viton, M. 1992, A&A, 263, 190.  
The Spacelab-1 very wide field survey of UV-excess objects. III.  
Analysis of the IUE high-resolution spectra of two very hot sdO  
stars

Djorgovski, S., Piotto, G. 1992, AJ, 104, 2112.  
Dynamical evolution effects on the hot stellar populations in  
globular clusters

Doyle, J.G., Keenan, F.P., Harra, L.K., Aggarwal, K.M., Tayal, S.S.  
1992, A&A, 261, 285.

Al II as an electron density diagnostic for the upper  
chromosphere/lower transition region in late-type stars

Doyle, J.G., van den Oord, G.H.J., Kellett, B.J. 1992, A&A, 262, 533.  
Dynamic phenomena on the RS Canum Venaticorum binary II Pegasi in  
August 1989. II. An interpretation

Doyle, J.G., Kellett, B.J., Butler, C.J., Byrne, P.B., Neff, J.E.,  
Brown, A., Fox, D., Linsky, J.E., Bromage, G.E., Avgoloupis, S.,  
Mavridis, L.N., Seiradakis, J.H., Mathiouidakis, M., Murphy, H.M.,  
Krzesinski, J., Pajdosz, G., Dadonas, V., Sperauskas, J.,  
van Wyk, F., Marang, F., Olah, K., Collier Cameron, A.,  
Antonopoulou, E., Rovithis, P., Rovithis-Livaniou, H. 1992, A&AS,  
96, 351.

Dynamic phenomena on the RS Canum Venaticorum binary II Pegasi in  
August 1989. I. Observational data

Doyle, J.G., Cook, J.W. 1992, APJ, 391, 393.

The sun as a star: high spectral resolution solar data degraded to  
low-dispersion IUE resolution

Drossart, P., Prange, R., Maillard, J.-P. 1992, ICARUS, 97, 10.  
Morphology of infrared H3+ emissions in the auroral regions of  
Jupiter

Dwek, E., Felten, J.E. 1992, APJ, 387, 551.

Line fluorescence from the ring around supernova 1987A

Eaton, J.A. 1992, MNRAS, 258, 473.

Intrinsic chromospheric emission from Zeta Aurigae binaries

Edelson, R. 1992, APJ, 401, 516.

A survey of ultraviolet variability in blazars

Edelson, R., Pike, G.F., Saken, J.M., Kinney, A., Shull, J.M. 1992,  
APJS, 83, 1.  
The Colorado IUE active galaxy survey. I. Blazars

Edgar, R.J., Savage, B.D. 1992, APJ, 396, 124.

Highly ionized gas in the Gum Nebula and elsewhere: a comparison of  
IUE and Copernicus satellite results

Esendemir, A., Alev, H.M. 1992, AP&SS, 197, 35.

X-ray vs He II lambda 1640 A correlation of II Peg

Evans, A., Bode, M.F., Duerbeck, H.W., Seitter, W.C. 1992, MNRAS, 258,  
7P.

IUE observations of the shells of RR Pic and GK Per

Evans, N.R., Arellano Ferro, A., Udalska, J. 1992, AJ, 103, 1638.  
The binary Cepheid BP Cir: A test of evolutionary tracks

Evans, N.R. 1992, AJ, 104, 216.

The luminosity of the classical Cepheid T Vul

Evans, N.R. 1992, APJ, 384, 220.

A magnitude-limited survey of Cepheid companions in the ultraviolet

Evans, N.R. 1992, APJ, 385, 680.

The luminosity of the double-mode Cepheid Y Carinae

Evans, N.R. 1992, APJ, 389, 657.

Roos, N. 1992, APJ, 385, 108.

Gas clouds from tidally disrupted stars in active galactic nuclei

Ross, R.R., Fabian, A.C., Mineshige, S. 1992, MNRAS, 258, 189.

The spectra of accretion discs in active galactic nuclei

Rossi, C., Altamore, A., Baratta, G.B., Friedjung, M., Viotti, R. 1992, A&A, 256, 133.

The spectrum of the VV Cephei star KQ Puppis (Boss 1985). III. A possible model

Rowlands, N., Houck, J.R., Hayward, T.L., Miles, J.W. 1992, APJ, 390, L93.

The high-excitation region of NGC 7027

Roy, J.-R., Aube, M., McCall, M.L., Dufour, R.J. 1992, APJ, 386, 498.

The origin of broad emission lines in the extragalactic giant H II region NGC 2363

- Russell, S.C., Dopita, M.A. 1992, APJ, 384, 508.  
Abundances of the heavy elements in the Magellanic Clouds. III.  
Interpretation of results
- Rutten, R.G.M., van Paradijs, J., Tinbergen, J. 1992, A&A, 260, 213.  
Reconstruction of the accretion disk in six cataclysmic variable stars
- Sahade, J., Barba, R., Kondo, Y. 1992, APJS, 81, 303.  
The orbital parameters and the IUE spectrum of the single-lined spectroscopic binary HD 698
- Saizar, P., Starrfield, S., Ferland, G.J., Wagner, R.M.,  
Truran, J.W., Kenyon, S.J., Sparks, W.M., Williams, R.E.,  
Stryker, L.L. 1992, APJ, 398, 651.  
A multiwavelength study of Nova QU Vulpeculae 1984
- Sambruna, R.M., Chiappetti, L., Treves, A., Bonnet-Bidaud, J.M.,  
Bouchet, P., Maraschi, L., Motch, C., Mouchet, M., Van Amerongen,  
S. 1992, APJ, 391, 750.  
X-ray to infrared observations of the cataclysmic variable KO Velorum (E 1013-477)
- Schrijver, C.J., Dobson, A.K., Radick, R.R. 1992, A&A, 258, 432.  
Nearly simultaneous observations of chromospheric and coronal radiative losses of cool stars
- Schroder, K.-P., Hunsch, M. 1992, A&A, 257, 219.  
Optical spectra of Zeta Aurigae systems. IV. The January 1990 eclipse of HR 2554: detection of chromospheric absorption and extended plasma at ~100,000 K
- Schulte-Ladbeck, R.E., Nordsieck, K.H., Code, A.D., Anderson, C.M.,  
Babler, B.L., Bjorkman, K.S., Clayton, G.C., Magalhaes, A.M.,  
Meade, M.R., Shepherd, D., Taylor, M., Whitney, B.A. 1992, APJ,  
391, L37.  
The first linear polarization spectra of Wolf-Rayet stars in the ultraviolet: EZ Canis Majoris and Theta Muscae
- Schulte-Ladbeck, R.E., Shepherd, D.S., Nordsieck, K.H., Code, A.D.,  
Anderson, C.M., Babler, B.L., Bjorkman, K.S., Clayton, G.C.,  
Magalhaes, A.M., Meade, M.R., Taylor, M., Whitney, B.A. 1992, APJ,  
401, L105.  
Evidence for a bipolar nebula around the peculiar B[e] star HD 45677 from ultraviolet spectropolarimetry
- Schultz, D., Li, G.S.H., Scherb, F., Roesler, F.L. 1992, ICARUS, 96,  
190.  
Comet Austin (1989c1) O(1D) and H<sub>2</sub>O production rates
- Schwarzenberg-Czerny, A., Udalski, A., Monier, R. 1992, APJ, 401, L19.  
Possible first detection of ultraviolet pulses from an intermediate polar: V603 Aquila

The radial velocity and binarity of X Persei
- Stickland, D.J. 1992, *OBS*, 112, 123.  
Radial velocities of the IUE calibration stars
- Stickland, D.J., Lloyd, C., Koch, R.H., Pachoulakis, I., Pfeiffer, R.J. 1992, *OBS*, 112, 150.  
Spectroscopic binary orbits from ultraviolet radial velocities.  
Paper 9: Y Cygni (HD 198846)
- Stickland, D.J., Koch, R.H., Pfeiffer, R.J. 1992, *OBS*, 112, 277.  
Spectroscopic binary orbits from ultraviolet radial velocities.  
Paper 10: CW Cephei (HD 218066)

Thejll, P. 1992, A&A, 264, 86.

Is the star 'BS' a member of the cluster 47 Tucanae?

Tomov, T., Zamanov, R., Kolev, D., Georgiev, L., Antov, A.,  
Mikolajewski, M., Esipov, V. 1992, MNRAS, 258, 23.

MWC 560: jets or optically thick expanding envelope?

Trafton, L.M., Watson, J.K.G. 1992, APJ, 385, 320.

Occurrence of global-scale emissions on Jupiter: proposed  
identification of Jovian dimer H<sub>2</sub> emission

Tweedy, R.W., Napiwotzki, R. 1992, MNRAS, 259, 315.

The central star of S 216

Ulrich, M.-H., Fink, H.H., Schaeidt, S., Baganoff, F., Malkan, M.A.,  
Heidt, J., Wagner, S. 1992, A&A, 266, 183.

Multiwavelength observations of the quasar Q 1821+643 during the  
ROSAT All Sky Survey

Vancura, O., Blair, W.P., Long, K.S., Raymond, J.C. 1992, APJ, 394,  
158.

A multiwavelength study of the supernova remnant N 49 in the Large  
Magellanic Cloud

Vancura, O., Blair, W.P., Long, K.S., Davidsen, A.F., Bowers, C.W.,  
Van Dyke Dixon, W., Durrance, S.T., Feldman, P.D., Ferguson, H.C.,  
Henry, R.C., Kimble, R.A., Kriss, G.A., Kruk, J.W., Moos, H.W.  
1992, APJ, 401, 220.

Far-ultraviolet observations of the supernova remnant N 49 using  
the Hopkins Ultraviolet Telescope

Vennes, S. 1992, APJ, 390, 590.

The constitution of the atmospheric layers and the extreme  
ultraviolet spectrum of hot hydrogen-rich white dwarfs

Vennes, S., Chayer, P., Thorstensen, J.R., Bowyer, S., Shipman, H.L.  
1992, APJ, 392, L27.

Iron abundance in the hot DA white dwarfs Feige 24 and G 191-B2B

Vennes, S., Fontaine, G. 1992, APJ, 401, 288.

An interpretation of the spectral properties of hot hydrogen-rich  
white dwarfs with stratified H/He model atmospheres

Vogel, M., Nussbaumer, H. 1992, A&A, 259, 525.

PU Vulpeculae: the outburst of a symbiotic nova

Vogel, M., Nussbaumer, H., Monier, R. 1992, A&A, 260, 156.

Absolute radius of an M giant

Walborn, N.R., Ebbets, D.C., Parker, J.W., Nichols-Bohlin, J.,  
White, R.L. 1992, APJ, 393, L13.

Ultraviolet and optical spectral morphology of Melnick 42 and  
Radcliffe 136a in 30 Doradus

Walter, D.K., Dufour, R.J., Hester, J.J. 1992, APJ, 397, 196.

CNO abundances and temperature fluctuations in the Orion Nebula

### **satellite tracking station**

## IUE Data Request

**Data Tape:** \_\_\_\_\_ (filled in by VILSPA)

**Tape Density:**  800 bpi  1600 bpi  6250 bpi

**Requested Data:**  Raw data only  Extracted high resolution spectra only  
 Line by line + extracted low dispersion spectra  
 Complete: raw image + extracted spectra

Camera numbers: 1 = LWP / 2 = LWR / 3 = SWP / 9 = FES

(for FES Photometric data use date (YYMMDD) and shift (G1/G2/VI) e.g. 920302VII (6250 bpi only))

**Request Reason** (mark corresponding circle):

- Normal Release (6 months rule)  
 Special Release  Data from my program . . . . .  
 others (give details) \_\_\_\_\_

**Requested by:** \_\_\_\_\_ **Date of Request:** \_\_\_\_\_

Mailing Address: \_\_\_\_\_

e-Mail / Tel. / FAX:

VILSPA Database Administrator: \_\_\_\_\_ Date: \_\_\_\_\_

Dr. M. Barylak  
Data Bank Resident Astronomer

## QUESTIONNAIRE FOR NEWSLETTER CIRCULATION

- Please note my change of address as below.  
(I attach the current mailing label for cancellation.)
- Having become acquainted with the ESA IUE Newsletter through a colleague/library, I would like to be placed on the regular mailing list. My name and address, including the post code, are given below.
- Please delete my name and address (printed below) from the Newsletter distribution list.

NAME:

ADDRESS:

Now tear off this last page and return it to ESA, Paris, in the convenient posting format provided. Simply fold and staple leaving the mailing address (verso) visible.

Mrs. S. Babayan  
European Space Agency  
8-10 rue Mario Nikis  
75738 Paris Cedex 15  
France
